**1. INTRODUCTION**  
The European-Mediterranean Seismic Hazard Map (E-M-SHM) is a product of the European Seismological Commission (ESC) and the International Geological Correlation Program (IGC) Project 382: SESAME. The map is based on the results of the SESAME project, which was a major international effort to assess the seismic hazard in the European-Mediterranean region. The map is intended to provide a comprehensive overview of the seismic hazard in the region, and to serve as a basis for the development of seismic hazard assessment and risk reduction measures.

**2. SCOPE AND LIMITATIONS**  
The map covers the European-Mediterranean region, including Europe, North Africa, and the Middle East. The map is based on the results of the SESAME project, which was a major international effort to assess the seismic hazard in the region. The map is intended to provide a comprehensive overview of the seismic hazard in the region, and to serve as a basis for the development of seismic hazard assessment and risk reduction measures.

**3. DATA SOURCES**  
The map is based on the results of the SESAME project, which was a major international effort to assess the seismic hazard in the region. Trifu, 2013-03-11 requiring the adaptation of probabilistic maps to design ground motions and the generalization of design parameters to locations where there is little seismic history Maximum displacements velocities and based on the European Building Code EC8 design ground acceleration maps have thus been produced by ZivCic et al for Slovenia Marku ic et al for Croatia Bus et al for Hungary and Radulian et al for Romania The last two contributions in the volume are dedicated to studies of local site effects that could affect the microzonation of large urban areas Moldoveanu et al employed a technique based on the modal summation and finite differences to calculate the expected ground motion in the capital city of Bucharest due to large intermediate depth Vrancea earthquakes Their results outline that the presence of alluvial sediments and the possible variation of event scenario require the use of all three components of motion for a reliable determination of the seismic input The study of Marmureanu et al more limited in scope offers a laboratory analysis of the attenuation effects for surface layers The authors confirm that seismic attenuation in sedimentary layers is a function of the strain levels induced by large earthquakes and find that the quality factor is nearly constant over a relatively wide frequency range between 7 and 100 Hz

**Earthquake Monitoring and Seismic Hazard Mitigation in Balkan Countries** Eystein S. Husebye, 2008-03-01 Seismology is rated the Queen of Earth Sciences due to its ability to provide detailed structural information bearing on the Earth interior and on going dynamic processes This is due to the advanced theoretical foundation of seismology and the extensive cooperation among seismologists on recording and disseminating of data worldwide In contrast some 40 years ago seismology was a backward science and hence funding was poor This abruptly changed with the political interest in seismology as the principal tool for monitoring compliance with a potential Comprehensive Nuclear Test Ban treaty CTBT banning nuclear testing in any environment Major countries like USA UK and USSR launched large scale research programs including deployment of modern seismograph stations and arrays and these developments are detailed in the book for CTBTO UN IRIS USA MedNet Italy Geofon Germany and the tiny Karelia network NW Russia Station and network operations require near real time record analysis and topics dealt with here are 2 D signal detector epicenter location and earthquake monitoring Balkan is seismically the most active part of Europe due to multiple plate interactions in the Aegean Sea The tectonic evolution and on going geodynamic deformations are described in 2 articles Earthquake hazard

analysis and topographic site effects are discussed and likewise large earthquake hazards in the Aegean and the Marmara seas relate to practical applications of such procedures. Foremost the book gives a good account of past, present and likely future seismological developments in Balkan countries and various kinds of network operations on local to global scales.

Rifting and Sediments in the Red Sea and Arabian Gulf Regions Najeeb M.A. Rasul, Ian C.F. Stewart, 2024-05-08. Rifting and Sediments in the Red Sea and Arabian Gulf Regions is a unique text that covers a wide range of topics related to the tectonics and geology of the Red Sea and Arabian Persian Gulf region. This book is a collection of invited and peer-reviewed chapters contributed by active researchers around the world. The topics covered in this book include tectonics, magmatism and lithology particularly in the Red Sea area. The book also delves into the sediments and evaporites of the Red Sea and Gulf. As the area around the Arabian Peninsula is prone to earthquakes, the seismic hazard estimated in the Red Sea region is also covered by several chapters. Each chapter presents new data and offers extensive lists of references for the reader to explore further. With the ongoing debates regarding the structure of the Red Sea, this book serves as an excellent resource for researchers and any individuals interested in the geology of these two unique seas.

Elements of Seismic Hazard in Mines Aleksander J. Mendecki, 2025-09-30. The main and first objective of this well-illustrated open access book is to introduce, define and explain common terms and concepts in earthquake and mine seismology. In seismology, diverse fields ranging from mathematics, classical mechanics, geology, rock and fracture mechanics to statistical physics with their specific jargon and terminology are brought together. Therefore, the language of earthquake and mine seismologists includes terms which may not be familiar to many geotechnical and mining engineers. For example, the proliferation of different earthquake magnitude scales has caused confusion about even this presumably simple concept, and statistical physics brought in a plethora of new terms into the seismological parlance. The second aim of this volume is to clarify some of the misconceptions in particular related to the analysis and interpretation of mining-related seismicity and to seismic hazard assessment for mines. As a third aim, the book stresses the need for testing the quality and integrity of the data before any analysis and assessment is attempted, the importance of quantifying observations and estimating the associated uncertainties. This book is primarily intended for mine seismologists and for mine geotechnical engineers who are or plan to become involved in advising mining companies on how to manage the seismic rock mass response to mining. The book will also be of interest to mining and geotechnical engineering students.

*Earthquake Science and Seismic Risk Reduction* F. Mulargia,R.J. Geller,2012-12-06 What is the first thing that ordinary people for whom journalists are the proxy ask when they meet a seismologist It is certainly nothing technical like What was the stress drop of the last earthquake in the Imperial Valley It is a simple question which nevertheless summarizes the real demands that society has for seismology This question is Can you predict earthquakes Regrettably notwithstanding the feeling of omnipotence induced by modern technology the answer at present is the very opposite of Yes of course The primary motivation for the question Can you predict earthquakes is practical No other natural phenomenon has the tremendous destructive power of a large earthquake a power which is rivaled only by a large scale war An earthquake in a highly industrialized region is capable of adversely affecting the economy of the whole world for several years But another motivation is cognitive The aim of science is understanding nature and one of the best ways to show that we understand a phenomenon is the ability to make accurate predictions **Seismic Retrofitting: Learning from**
