Molecular Spectroscopy of Dense Phases, 1976 **Molecular Spectroscopy** R F Barrow, Derek A Long, J

Sheridan, 2007-10-31 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular critical in-depth accounts of progress in particular areas of chemistry. For over 80 years, the Royal Society of Chemistry and its predecessor, the Chemical Society, have been publishing reports charting developments in chemistry, which originally took the form of Annual Reports. However, by 1967, the whole spectrum of chemistry could no longer be contained within one volume, and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two, and subsequently three volumes covering Inorganic, Organic, and Physical Chemistry. For more general coverage of the highlights in chemistry, they remain a must. Since that time, the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. Some titles have remained unchanged, while others have altered their emphasis along with their titles; some have been combined under a new name, whereas others have had to be discontinued. The current list of Specialist Periodical Reports can be seen on the inside flap of this volume.

Molecular Spectroscopy of Dense Phases M. Grosmann, S. G. Elkomoss, J. Ringeissen, 1975 **Condensed-Phase**

Molecular Spectroscopy and Photophysics Anne Myers Kelley, 2012-11-15 An introduction to one of the fundamental tools in chemical research, spectroscopy and photophysics in condensed phase and extended systems. A great deal of modern research in chemistry and materials science involves the interaction of radiation with condensed phase systems, such as molecules in liquids and solids, as well as molecules in more complex media, molecular aggregates, metals, semiconductors, and composites. Condensed Phase Molecular Spectroscopy and Photophysics was developed to fill the need for a textbook that introduces the basics of traditional molecular spectroscopy with a strong emphasis on condensed phase systems. It also examines optical processes in extended systems, such as metals, semiconductors, and conducting polymers, and addresses the unique optical properties of nanoscale systems. Condensed Phase Molecular Spectroscopy and Photophysics begins with an introduction to quantum mechanics that sets a solid foundation for understanding the text's subsequent topics, including Electromagnetic radiation and radiation-matter interactions, Molecular vibrations and infrared spectroscopy, Electronic spectroscopy, Photophysical processes and light scattering, Nonlinear and pump-probe spectroscopies, Electron transfer processes. Each chapter contains problems ranging from simple to complex, enabling readers to gradually build their skills and problem-solving abilities. Written for upper-level undergraduate and graduate courses in physical and materials chemistry, this text is uniquely designed to equip readers to solve a broad array of current problems and challenges in chemistry. **Molecular Spectroscopy Volume 5** R. Molecular Spectroscopy Jeanne L. McHale, 2017-07-06 This textbook offers an introduction to the foundations of spectroscopic methods and provides a bridge between basic concepts and experimental applications in fields as diverse as materials science biology solar energy conversion and environmental science The author emphasizes the use of time dependent theory to link the spectral response in the frequency domain to the behavior of molecules in the time domain strengthened by two brand new chapters on nonlinear optical spectroscopy and time resolved spectroscopy Theoretical underpinnings are presented to the extent necessary for readers to understand how to apply spectroscopic tools to their own interests

Molecular Spectroscopy Chemical Society (Great Britain), R. F. Barrow, **Hermann Haken: From the Laser to**

Synergetics Bernd Kröger, 2014-11-25 Hermann Haken born 1927 is one of the fathers of the quantum mechanical laser theory formulated between 1962 and 1966 in strong competition with American researchers. Later on he created Synergetics, the science of cooperation in multicomponent systems. The book concentrates on the development of his scientific work during the first thirty five years of his career. In 1970 he and his doctoral student Robert Graham were able to show that the laser is an example of a nonlinear system far from thermal equilibrium that shows a phase transition like behavior. Subsequently this insight opened the way for the formulation of Synergetics. Synergetics is able to explain how very large systems show the phenomenon of self organization that can be mathematically described by only very few order parameters. The results of Haken's research were published in two seminal books: *Synergetics* 1977 and *Advanced Synergetics* 1983. After the year 1985 Haken concentrated his research on the macroscopic foundation of Synergetics. This led him towards the application of synergetic principles in medicine, cognitive research and finally in psychology. A comprehensive bibliography of Hermann Haken's publications, nearly 600 numbers, is included in the book *Aqueous Phase Adsorption* Jayant K Singh, Nishith Verma, 2018-10-25. This book covers theoretical aspects of adsorption followed by an introduction to molecular simulations and other numerical techniques that have become extremely useful as an engineering tool in recent times to understand the interplay of different mechanistic steps of adsorption. Further, the book provides brief experimental methodologies to use test and evaluate different types of adsorbents for water pollutants. Through different chapters contributed by accomplished researchers working in the broad area of adsorption, this book provides the necessary fundamental background required for an academician, industrial scientist or engineer to initiate studies in this area. Key Features: Explores fundamentals of adsorption based separation; Provides physical insight into aqueous phase adsorption; Includes theory, molecular and mesoscopic level simulation techniques and experiments; Describes molecular simulations and lattice Boltzmann method based models for aqueous phase adsorption; Presents state of art experimental works particularly addressing removal of emerging pollutants from aqueous phase. *Gas-Phase IR Spectroscopy and Structure of Biological Molecules* Anouk M. Rijs, Jos Oomens, 2015-06-03. The series *Topics in Current Chemistry* presents critical reviews of the present and future trends in modern chemical research. The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology, medicine and materials science. The goal of each thematic volume is to give the non specialist reader, whether in academia or industry, a comprehensive insight into an area where new research is emerging, which is of interest to a larger scientific audience. Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole. The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed. The coverage is not intended to be an exhaustive summary of the field or include large quantities of data but should rather be conceptual, concentrating on the methodological thinking that will allow the non specialist reader to understand the information presented. Contributions also

offer an outlook on potential future developments in the field Review articles for the individual volumes are invited by the volume editors Readership research chemists at universities or in industry graduate students
