Climate Controls on

Stratigraphy C. B. Cecil, N. Terence Edgar, 2003 The role of climate as a primary control on stratigraphy is the cornerstone of this volume The emphasis on climate is in distinct contrast to most previous studies in which stratigraphic variability has been related to changes in sea level and in tectonic activity Furthermore the findings derived from several years of detailed study of modern and ancient key geologic sections around the world indicate that traditional depositional models generally do not fully explain the origin of fossil fuels Although the results of the studies presented in this volume are intended to contribute to the disciplines of sedimentary geology and stratigraphy the contributors recognize that their results may also contribute to a better understanding of global climate change The theoretical background of climate control on sediment supply and stratigraphy is presented in the volume With this background in place detailed documentation and analysis of climate control on the lithologic variation of a single Middle Pennsylvanian
