Disorders: Gaining New Insights from Modeling and Experimentation to Influence the Clinic Daniela Andres,Olivier
Darbin,Marcelo Merello,2017-10-31 The basal ganglia constitute a group of subcortical structures highly interconnected
among themselves as well as with the cerebral cortex thalamus and other brain areas These nuclei play a central role in the
control of voluntary movement and their specific pathology comprises the group of diseases known as movement disorders
including Parkinson s disease Huntington s disease dystonia and Gilles de la Tourette syndrome among others Additionally
the presence of a number of circuits within the basal ganglia related to non motor functions has been acknowledged
Currently the basal ganglia are thought to participate in cognitive limbic and learning functions Moreover disorders related
to the basal ganglia are known to involve a number of complex non motor symptoms and syndromes e g compulsive and
addictive behavior In the light of this evidence it is becoming clear that our knowledge about the basal ganglia needs to be
revised and that new pathophysiological models of movement disorders are needed In this context the study of the
pathophysiology of the basal ganglia and the treatment of their pathology is becoming increasingly interdisciplinary
Nowadays an appropriate approach to the study of these problems must necessarily involve the use of complex mathematical
modeling computer simulations basic research ranging from biomolecular studies to animal experimentation and clinical
research This research topic aims to bring together the most recent advances related to the pathophysiology of the basal
ganglia and movement disorders The Basal Ganglia VIII John Paul Bolam,Cali A. Ingham,Peter J. Magill,2006-06-26 The
aim of the International Meetings of the Basal Ganglia Society IBAGS is to provide a unique environment for the open
presentation and discussion of new and challenging information about the basal ganglia as it relates to health and disease
covering all areas of basic science and research Specific topics of the proceedings of this Eighth International Triennial
Meeting of the Basal Ganglia Society include behavior circuitry functional imaging modelling movement disorders
neuropathology neurotransmitters pharmacology physiology plasticity treatments for basal ganglia disorders ventral systems
health and disease immunology and basal ganglia and much more **The Basal Ganglia VI** Ann M. Graybiel,Mahlon R.
DeLong,Stephen T. Kitai,2012-12-06 This volume the sixth in the IBAGS series summarizes major contributions in clinical and
basic research on the basal ganglia The sixth meeting of the Society was held on Cape Cod in the state of Massachusetts USA

in October 1998 Altogether 16 countries were represented by 227 participants This volume contains papers contributed by participants The focus of the sixth triennial IBAGS meeting and of this volume was to bring together leaders in basic and clinical science to address two sets of still persisting questions in the field The first set focuses on the functions of the basal ganglia in health and disease What are the core functions of the basal ganglia and cortico basal ganglia loops How are these core functions disrupted in disorders affecting the basal ganglia How do we account for the broad range of behaviors affected by basal ganglia disorders and for the increasing evidence that the basal ganglia influence cognitive as well as motor functions These issues are addressed in the first five sections of the current volume which summarize advances in the study of basal ganglia disorders based on studies in humans Section 1 new results obtained with experimental animal models of basal ganglia disorders Section 2 results of experiments on information coding in the basal ganglia Section 3 and new information about functions of the basal ganglia related to learning and adaptive motor control Section 4
