- Urinary calculi may remain within the renal parenchyma or renal pelvis or be passed into the ureter and bladder.
- During passage, calculi may irritate the ureter and may become lodged (ureteropelvic junction, ureterovesical junction) obstructing urine flow and causing hydroureter and sometimes hydronephrosis
- Typically, a calculus must have a diameter  $> 5$  mm to become lodged. Calculi  $\leq 5$  mm are likely to pass spontaneously.
- Obstruction causes
  - ✓ decreased glomerular filtration
  - ✓ declines renal blood flow and worsening renal function (hydronephrosis and elevated glomerular pressure)
  - ✓ in the absence of infection permanent renal dysfunction occurs only after about 28 days of complete obstruction.
  - ✓ Secondary infection can occur with long-standing obstruction
