A small vacuum capacitor is connected in parallel with each section of the proposed tuning reactance for proper alignment of the circuit. These small vacuum capacitors for independent alignment of the circuit sections. The detector stage is considered as a diode, since the grid and the plate are connected together. Figure 112 is a circuit emphasized to facilitate study.

3. In Figure 113, all grids of the T-F receiver are grounded, as shown, potential are denoted by heavy lines. All points on the heavy line are at the same potential, which is considered to be zero with respect to the rest of the receiver circuit. All voltages in the circuit are compared to this ground potential.

4. In Figure 114, all of the elements of the T-F receiver at high $r-f$ potential are denoted by heavy lines. The source of this potential is a radio signal to tune the path of the $r-f$ signal from the antenna down to the diode detector.

5. In Figure 115, the high voltage for plate supply is shown by heavy lines. When the switch is closed, the first pentode receives the high positive plate voltage necessary for their action as amplifiers. The diode operating as a detector, does not require the plate voltage. The dc coupling condenser in the plate leads of the first three provides.

6. In Figure 116, the complete detector circuit is shown in heavy lines. The tube used in this stage is considered to be a diode. The grid and the plate of the triode are connected, or tied together, resulting in a two-element tube, or diode. The rectified or detected signal is taken
