

The effects on the blood cells of animals and man from exposure to single doses of whole-body radiation delivered over a short period of time (<24 hr) have been studied extensively. Observations of effects in man have been made on Japanese atomic-bomb victims [Liebow *et al.*, 1949; LeRoy, 1950]; the Marshallese natives exposed to fallout radiation [Cronkite *et al.*, 1955; Conard and Hicking, 1965]; reactor and criticality accident cases [Hempelmann *et al.*, 1952; Guskova and Baisogolov, 1956; Hasterlik and Marinelli, 1956; Brucer, 1959; Jammet *et al.*, 1959; Thoma and Wald, 1959; Bond *et al.*, 1960; Shipman *et al.*, 1961]; therapeutically irradiated cancer patients [Miller *et al.*, 1958]; and patients exposed for other medical reasons [Tubiana *et al.*, 1961; Hamburger *et al.*, 1962; Kuss *et al.*, 1962; Wald *et al.*, 1962]. The majority of these studies have consisted of observations of effects on the number of formed elements in the peripheral blood (hematological effects) as an index of severity of exposure. In recent years such studies have been extended to effects on the bone marrow directly and to production of chromosomal aberrations in somatic cells, usually by means of cell-culturing methods.

NATURE OF HEMATOLOGICAL SYNDROME

Hematological responses to radiation are largely dependent on damage to the bone marrow. The blood-forming marrow is encased in bone, the amount varying from one bone to the other; the ribs, vertebral column, and pelvic bones contain the greatest amount. The role of the lymphatic tissues (outside the bone marrow), which furnish lymphocytes to the blood, is not well understood, but lymphocytes are not considered as important to survival as are the bone-marrow cells. The degree of radiation damage to the bone marrow is reflected in peripheral blood counts. Lowering of levels of peripheral blood elements, therefore, is brought about largely by damage to the formative cells of the bone marrow and to the cells of the lymphatic tissues. Inhibition of cell division and cytological damage in the bone marrow can be seen shortly after irradiation. Heineke, as early as 1905, described destruction of bone-marrow cells following irradiation [Heineke, 1905]; since that time such changes have been well documented [Dunlap, 1942]. Fliedner *et al.* [1959] have reported such findings in the Oak Ridge Y-12 criticality accident victims. Damage to the genetic apparatus of the cells (i.e., the chromosomes) was evident with inhibition of cell

Space Radiation Biology and Related Topics Cornelius A. Tobias,Paul Todd,2013-10-22 Space Radiation Biology and Related Topics provides information pertinent to the fundamental aspects of space radiation biology. This book discusses space radiation hazards as well as the importance of natural radiations in the processes of biogenesis. Organized into 12 chapters this book begins with an overview of the fundamental aspects of radiobiology. This text then discusses the theoretical treatments of the chronic radiation response and the applicability of some of its features in extended manned space missions. Other chapters review the literature on models for recovery from radiation damage to some cellular systems. This book discusses as well the effects of radiations on mammals with emphasis on those effects pertinent to the space flight situation. The final chapter deals with the safety of nuclear power in space and explains the three types of nuclear devices designed for power production in space. This book is a valuable resource for radiologists radiobiologists and radiotherapists

National Library of Medicine Current Catalog National Library of Medicine (U.S.),1965 *Military Radiobiology* James Conklin,2012-12-02 Military Radiobiology provides an understanding of the sources and consequences of radiation exposure. Military personnel must develop a working knowledge of postexposure effects in order to determine points of intervention. The medical problems confronting military radiobiology include target damage which causes decrements in normal performance physiological injury and impairments of the immunological hematological system that lead to life threatening infectious complications. The book begins by describing the properties of nuclear weapons including the mechanisms by which nuclear energy is stored within the nucleus its release and its conversion to those forces associated with nuclear weapons. This is followed by discussions of the sources patterns radiological effects and management of nuclear fallout the biological effects of exposure to ionizing radiation released by nuclear weapons and effects of radiation on the immune system gastrointestinal physiology and cardiovascular function. Subsequent chapters cover the diagnosis triage and treatment of radiation associated injuries internal contamination with radionuclides radioprotective drugs psychological reactions to nuclear confrontation and the response to a nuclear weapon accident
