Learning

Learning: the process of acquiring through experience new and relatively enduring information or behaviors.

Associative learning: learning that certain events occur together. The events may be two stimuli (as in classical conditioning) or a response and its consequence (as in operant conditioning).

This process of learning associations is conditioning. It takes two main forms:

In classical condition, we learn to associate two stimuli and thus to anticipate events. (A stimulus is any event or situation that evokes a response.) We learn that a flash of lightning signals an impending crack of thunder; when lightning flashes nearby, we start to brace ourselves. We associate stimuli that we do not control, and we respond automatically (exhibiting respondent behavior).

In operant conditioning, we learn to associate a response (our behavior) and its consequence. Thus, we (and other animals) learn to repeat acts followed by good results and avoid acts followed by bad results. These associations produce operant behaviors (which operate on the environment to produce consequences).

Stimulus: any event or situation that evokes a response.

Respondent behavior: behavior that occurs as an automatic response to some stimulus.

Operant behavior: behavior that operates on the environment, producing a consequence.

Cognitive learning: the acquisition of mental information, whether by observing events, by watching others, or through language.

Classical conditioning: a type of learning in which we link two or more stimuli; as a result, to illustrate with Pavlov's classic experiment, the first stimulus (a tone) comes to elicit behavior (drooling) in anticipation of the second stimulus (food).

Ivan Pavlov "Experimental investigation ... should lay a solid foundation for a future true science of psychology".
