Copyright Office,1978 Protein Interactions Peter Schuck,2007-03-20

When I was invited to edit this volume I wanted to take the opportunity to assemble reviews of different biophysical methodologies for protein interactions at a level sufficiently detailed to understand how complex systems can be studied There are several excellent introductory texts for biophysical methodologies many with hands on descriptions or embedded in general introductions to physical chemistry The goal of the present volume was to present state of the art reviews that do not necessarily enable the reader to carry out these techniques but to gain a deep understanding of the biophysical observables to stimulate creative thought on how the techniques may be applied to study a particular biological system and to foster collaboration and multidisciplinary work Reversible protein interactions involve noncovalent chemical bonds pro

cing protein complexes with free energies not far from the order of magnitude of the thermal energy kT . As a consequence they can be highly dynamic and may be controlled for example by protein expression levels and changes in the intracellular or microenvironment. Reversible protein complexes may have sufficient stability to be purified for study but frequently their short lifetime essentially limits their existence to solutions of mixtures of the binding partners in which they remain populated through dissociation and reassociation processes. To understand the function of such protein complexes it is important to study their structure and dynamics.
