Recent Advances In Stratospheric Processes 1999 Rs:

Fast Processes in Large-Scale Atmospheric Models Yangang Liu, Pavlos Kollias, 2023-12-19 Improving weather and climate prediction with better representation of fast processes in atmospheric models Many atmospheric processes that influence Earth's weather and climate occur at spatiotemporal scales that are too small to be resolved in large scale models They must be parameterized which means approximately representing them by variables that can be resolved by model grids Fast Processes in Large Scale Atmospheric Models Progress Challenges and Opportunities explores ways to better investigate and represent multiple parameterized processes in models and thus improve their ability to make accurate climate and weather predictions Volume highlights include Historical development of the parameterization of fast processes in numerical models Different types of major sub grid processes and their parameterizations Efforts to unify the treatment of individual processes and their interactions Top down versus bottom up approaches across multiple scales Measurement techniques observational studies and frameworks for model evaluation Emerging challenges new opportunities and future research directions The American Geophysical Union promotes discovery in Earth and space science for the benefit of humanity Its publications disseminate scientific knowledge and provide resources for researchers students and professionals

The Aeronautical Journal, 2002

High Resolution Numerical Modelling of the Atmosphere and Ocean Kevin Hamilton, Wataru Ohfuchi, 2007-12-25 Many key issues in dynamical meteorology and physical oceanography depend on interactions among diverse spatial scales Atmospheric examples are the role of small scale gravity waves in the zonal mean momentum balance in the middle atmosphere the role of tropical cyclones in the large scale energy and momentum balances of the troposphere or even the

direction of spectral cascades of variance in the mesoscale In the ocean issues of this type include understanding the detailed physics of the very narrow boundary currents that occur along many coastlines and the role of mesoscale eddies in determining the strength of the large scale circulations and meridional ocean heat transports Truly comprehensive observational diagnostic studies of these issues are essentially impossible since they would require the global observational overage at extremely high spatial resolution An alternative is to study such issues in high resolution models that may span 3 or more orders of magnitude in terms of spatial scales There has been a great deal of progress recently on development and application of such fine resolution models This had been spurred in part by the recent availability of exceptionally powerful computers Noteworthy in this respect is the Earth Simulator in Yokohama Japan which commenced operations in 2002 and provides a peak performance of 40 Terraflops but competitive supercomputers for scientific applications are now becoming available in the USA and Europe as well There has developed in the last few years an increased understanding of the scientific value of results from very high resolution comprehensive numerical simulations This book documents the first international meeting focused specifically on high resolution atmospheric and oceanic modeling held at the Earth Simulator Center Rather than producing a standard conference proceedings it includes papers written by invited speakers at the meeting reporting on their most exciting recent results involving high resolution modeling
