Contemporary high frequency engineering design heavily relies on full wave electromagnetic EM analysis This is primarily due to its versatility and ability to account for phenomena that are important from the point of view of system performance Unfortunately versatility comes at the price of a high computational cost of accurate evaluation Consequently utilization of simulation models in the design processes is challenging although highly desirable The aforementioned problems can be alleviated by means of surrogate modeling techniques the most popular of which are data driven models Although a large variety of methods are available they are all affected by the curse of dimensionality This is especially pronounced in high frequency electronics where typical system responses are highly nonlinear Construction of practically useful surrogates covering wide ranges of parameters and operating conditions is a considerable challenge Surrogate Modeling for High Frequency Design presents a selection of works representing recent advancements in surrogate modeling and their applications to high frequency design Some chapters provide a review of specific topics such as neural network modeling of microwave components while others describe recent attempts to improve existing modeling methodologies Furthermore the book features numerous applications of surrogate modeling methodologies to design optimization and uncertainty quantification of antenna microwave and analog RF circuits      **New Topics in Simulation and Modeling of RF Circuits** Alexandru Gabriel Gheorghe, Florin Constantinescu, 2022-09-01 New Topics in Simulation and Modeling of RF Circuits

addresses two main topics simulation of RF circuits and new models of nonlinear power BAW resonators and filters Since RF circuits have several unique features and all analysis methods are based on the circuit essential properties the book begins by describing the properties of RF circuits characterization of circuits with customary and uncusomary behavior and some theorems of solutions existence and uniqueness for dynamic nonlinear circuits Thereafter the main time domain and frequency domain analysis methods for RF circuits are presented The advantages and disadvantages of each method have been highlighted and an algorithm for the time step choice in transient analysis based on energy balance errors is also presented Lastly the final part contains some nonlinear circuit models of power BAW resonators The behavioral models for the time domain analysis are simple circuits containing weakly nonlinear elements The behavioral models for frequency domain analysis are based on the measured values of the frequency dependent S parameters for a set of incident powers S parameters corresponding to certain intermodulation products of practical interest are also considered The physical models contain artificial transmission lines with nonlinear circuit elements corresponding to mechanical and electrical nonlinearities
