ABSTRACT:

Understanding temporal urban growth is very crucial to the interpretation of urban morphology and a key challenge for the study of rapid urbanization in contemporary China. Previous land use change modelling approaches only consider the spatial complexity that may be indicated by spatial dependence and landscape fragmentation, ignoring the temporal complexity inherent in the process of urban growth. Multi-temporality is a typical characteristic of urban growth and multi-temporal data availability has been much improved due to great advance in geospatial technology particularly remotely sensed imagery. This paper proposes an innovative application of a machine learning method – Maxent for analysing the urban morphology of a fast growing city – Wuhan, China. Multi-temporal data sets for 1955, 1965, 1993 and 2000 were processed from remotely sensed imagery. The results demonstrate that Maxent is an effective exploratory method and tool for understanding urban morphology.

1. INTRODUCTION

Rapid urbanisation has stimulated fast urban growth occurring in Chinese cities and other developing countries. Wuhan, a mega city in Central China, has seen its urban built-up areas grow tenfold between 1955 and 2000 (Cheng and Masser, 2003). Understanding temporal dynamics of urban form and urban land cover/land use is a prerequisite to making appropriate sustainable urban development policies and strategies. Stimulated by rapid advances in geospatial technologies, high-resolution remotely sensed imagery has become widely available and at low cost. Such factors have made monitoring urban growth possible and more successful in developing countries. Moreover, various models have been developed and explored for interpreting, predicting and simulating urban development pattern and processes and assisting the decision support of urban growth management and planning. Among these models, logistic regression, cellular automata and multi agent system methods have received a lot of attention. However, most models are only focused on the spatial complexity of urban growth system, not on temporal complexity. Urban growth is a continuous process, which means that new buildings, roads, and commercial centres emerge temporally accidentally. Multi-temporality is a typical characteristic of urban morphology. Three classic theories of urban morphology were developed in the 1970s: the concentric zone theory, the sector theory and the multiple nuclei theory. These theories have defined morphological factors (e.g. distance to city centre(s), distance to main corridors) which affect urban development patterns. Morphology analysis makes it possible to summarise the changes and trends of the urban spatial structure. For example, we need to establish the dominant morphological factors (e.g. proximity and development density) driving urban growth in multi-temporal periods. Such findings can make a useful contribution to the local knowledge of urban development planning.

The availability of multi-temporal data sets offers great opportunity for measuring and understanding urban

morphology. However, previous studies in urban morphology were focused on the measurement of urban morphology using methods such as fractals, density gradient and landscape matrix. These methods only provide single or multiple indicators for spatially measuring urban morphology, instead of temporally modelling urban morphology. Multi-temporal spatial modelling is still not well developed in geospatial areas. In this paper, we propose an innovative application of a machine learning method – Maxent, for analysing urban morphology of a fast growing city (Wuhan, China). Multi-temporal data sets are available for 1955, 1965, 1993 and 2000, which were processed from remotely sensed imagery. This research has demonstrated that Maxent is an effective exploratory method and tool in helping understand urban morphology.

2. DATA & METHODOLOGY

2.1 Data sources and processing

Wuhan is located in Central China on the middle reaches of the Yangtze River. Wuhan municipality, the capital of Hubei province, has a total population of about 8 million over an area of 2000 km² in 2007. Wuhan is known as ‘Water City’ (*Li Jiang cheng*) due to the two rivers (Yangtze and Han rivers) that intersect here, and the surrounding lakes. In previous research (Cheng, 2003), temporal urban growth of Wuhan from 1955 to 2000 has been mapped (see figure 1) based on primary data sources composed of aerial photographs from 1955 (scale 1:25000) and 1965 (scale 1:80000), SPOT Pan/CS images taken in 1986 and 2000, and secondary data sources (e.g. land use map of 1993, topographic maps of 1993, traffic and tourism maps and master plan schemes). Land conversion was detected and classified using the maximum likelihood method (SPOTs) and visual interpretation (photographs).

Modelling urban spatial change: a review of international and South African modelling initiatives Chris Wray, 2013-08-30 Urban growth and land use change models have the potential to become important tools for urban spatial planning and management Before embarking on any modelling however GCRO felt it was important to take note of and critically assess lessons to be learnt from international experience and scholarship on spatial modelling as well as a number of South African experiments that model future urban development In 2012 GCRO initiated preliminary research into current international and South African modelling trends through a desktop study and telephone email and personal interviews This Occasional paper sets out to investigate what urban spatial change modelling research is currently being undertaken internationally and within South Africa At the international level urban modelling research since 2000 is reviewed according to five main categories land use transportation LUT cellular automata urban system dynamics agent based models ABMs and spatial economics econometric models SE EMs Within South Africa urban modelling initiatives are categorised differently and include a broader range of urban modelling techniques Typologies used include provincial government modelling initiatives in Gauteng municipal government modelling initiatives other government funded modelling research and academic modelling research The various modelling initiatives described are by no means a comprehensive review of all urban spatial change modelling projects in South Africa but provide a broad indication of the types of urban spatial change modelling

underway Importantly the models may form the basis for more accurate and sophisticated urban modelling projects in the future The paper concludes by identifying key urban modelling opportunities and challenges for short to long term planning in the GCR and South Africa
