Nonlinear Dynamics and Chaos with Applications to Hydrodynamics and Hydrological Modelling Slavco Velickov, 2014-04-21 The theory of nonlinear dynamics and chaos and the extent to which recent improvements in the understanding of inherently nonlinear natural processes present challenges to the use of mathematical models in the analysis of water and environmental systems are elaborated in this work

System-Theoretic Methods in Economic Modelling II S. Mitnik, 2014-06-28 System Theoretic Methods in Economic Modelling II complements the editor's earlier volume bringing together current research efforts integrating system theoretic concepts with economic modelling processes The range of papers presented here goes beyond the long accepted control theoretic contributions in dynamic optimization and focuses on system theoretic methods in the construction as well as the application stages of economic modelling This volume initiates new and intensifies existing debate

between researchers and practitioners within and across the disciplines involved with the objective of encouraging interdisciplinary research. The papers are split into four sections: estimation, filtering and smoothing problems in the context of state space modelling; applying the state space concept to financial modelling; modelling rational expectation and a miscellaneous section including a follow up case study by Tse and Khilnani on their integrated system model for a fishery management process which featured in the first volume. Generalized Linear Models and Extensions, Second Edition James W. Hardin, James William Hardin, Joseph M. Hilbe, Joseph Hilbe, 2007. Deftly balancing theory and application, this book stands out in its coverage of the derivation of the GLM families and their foremost links. This edition has new sections on discrete response models including zero truncated, zero inflated, censored and hurdle count models as well as heterogeneous negative binomial and more. *Spatio-Temporal Models for Ecologists* James Thorson, Kasper Kristensen, 2024-02-27. Ecological dynamics are tremendously complicated and are studied at a variety of spatial and temporal scales. Ecologists often simplify analysis by describing changes in density of individuals across a landscape and statistical methods are advancing rapidly for studying spatio-temporal dynamics. However, spatio-temporal statistics is often presented using a set of principles that may seem very distant from ecological theory or practice. This book seeks to introduce a minimal set of principles and numerical techniques for spatio-temporal statistics that can be used to implement a wide range of real-world ecological analyses regarding animal movement, population dynamics, community composition, causal attribution and spatial dynamics. We provide a step-by-step illustration of techniques that combine core spatial analysis packages in R with low-level computation using Template Model Builder. Techniques are showcased using real-world data from varied ecological systems, providing a toolset for hierarchical modelling of spatio-temporal processes. *Spatio-Temporal Models for Ecologists* is meant for graduate-level students alongside applied and academic ecologists. Key Features: Foundational ecological principles and analyses; Thoughtful and thorough ecological examples; Analyses conducted using a minimal toolbox and fast computation; Code using R and TMB included in the book and available online. Bayesian and graphical Models for Biomedical Imaging M. Jorge Cardoso, Ivor Simpson, Tal Arbel, Doina Precup, Annemie Ribbens, 2014-09-22. This book constitutes the refereed proceedings of the First International Workshop on Bayesian and graphical Models for Biomedical Imaging (BAMBI 2014) held in Cambridge, MA, USA, in September 2014, as a satellite event of the 17th International Conference on Medical Image Computing and Computer Assisted Intervention (MICCAI 2014). The 11 revised full papers presented were carefully reviewed and selected from numerous submissions with a key aspect on probabilistic modeling applied to medical image analysis. The objectives of this workshop, compared to other workshops (e.g. machine learning in medical imaging), have a stronger mathematical focus on the foundations of probabilistic modeling and inference. The papers highlight the potential of using Bayesian or random field graphical models for advancing scientific research in biomedical image analysis or for the advancement of modeling and analysis of medical imaging data. *Mathematical Models* Arnold Emch, 1928. Shepherd,2012-12-06 About This Book This

book is about training methods in particular fast second order training methods for multi layer perceptrons MLPs MLPs also known as feed forward neural networks are the most widely used class of neural network Over the past decade MLPs have achieved increasing popularity among scientists engineers and other professionals as tools for tackling a wide variety of information processing tasks In common with all neural networks MLPs are trained rather than programmed to carry out the chosen information processing function Unfortunately the traditional method for training MLPs the well known backpropagation method is notoriously slow and unreliable when applied to many practical tasks The development of fast and reliable training algorithms for MLPs is one of the most important areas of research within the entire field of neural computing The main purpose of this book is to bring to a wider audience a range of alternative methods for training MLPs methods which have proved orders of magnitude faster than backpropagation when applied to many training tasks The book also addresses the well known local minima problem and explains ways in which fast training methods can be combined with strategies for avoiding or escaping from local minima All the methods described in this book have a strong theoretical foundation drawing on such diverse mathematical fields as classical optimisation theory homotopic theory and stochastic approximation theory
