Jacobson, 2013-03-09 The present volume is the second in the author's series of three dealing with abstract algebra For an understanding of this volume a certain familiarity with the basic concepts treated in Volume I groups rings fields homomorphisms is presupposed However we have tried to make this account of linear algebra independent of a detailed knowledge of our first volume References to specific results are given occasionally but some of the fundamental concepts needed have been treated again In short it is hoped that this volume can be read with complete understanding by any student who is mathematically sufficiently mature and who has a familiarity with the standard notions of modern algebra Our point of view in the present volume is basically the abstract conceptual one However from time to time we have deviated somewhat from this Occasionally formal calculational methods yield sharper results Moreover the results of linear algebra are not an end in themselves but are essential tools for use in other branches of mathematics and its applications It is therefore useful to

have at hand methods which are constructive and which can be applied in numerical problems These methods sometimes necessitate a somewhat lengthier discussion but we have felt that their presentation is justified on the grounds indicated A student well versed in abstract algebra will undoubtedly observe short cuts Some of these have been indicated in footnotes We have included a large number of exercises in the text

Golden Modern Algebra A. Mahindroo, 2005 *Modern Algebra* Mary P. Dolciani, 1965 **Algebra II** Alexey L. Gorodentsev, 2017-02-12 This book is the second volume of an intensive Russian style two year undergraduate course in abstract algebra and introduces readers to the basic algebraic structures fields rings modules algebras groups and categories and explains the main principles of and methods for working with them The course covers substantial areas of advanced combinatorics geometry linear and multilinear algebra representation theory category theory commutative algebra Galois theory and algebraic geometry topics that are often overlooked in standard undergraduate courses This textbook is based on courses the author has conducted at the Independent University of Moscow and at the Faculty of Mathematics in the Higher School of Economics The main content is complemented by a wealth of exercises for class discussion some of which include comments and hints as well as problems for independent study

Modern Algebra and the Rise of Mathematical Structures Leo Corry, 2012-12-06 The book describes two stages in the historical development of the notion of mathematical structures first it traces its rise in the context of algebra from the mid nineteenth century to its consolidation by 1930 and then it considers several attempts to formulate elaborate theories after 1930 aimed at elucidating from a purely mathematical perspective the precise meaning of this idea First published in the series Science Networks Historical Studies Vol 17 1996 In the second revised edition the author has eliminated misprints revised the chapter on Richard Dedekind and updated the bibliographical index

Linear Algebra II Frederick P. Greenleaf, Sophie Marques, 2020-05-06 This book is the second of two volumes on linear algebra for graduate students in mathematics the sciences and economics who have a prior undergraduate course in the subject a basic understanding of matrix algebra and some proficiency with mathematical proofs Both volumes have been used for several years in a one year course sequence Linear Algebra I and II offered at New York University's Courant Institute The first three chapters of this second volume round out the coverage of traditional linear algebra topics generalized eigenspaces further applications of Jordan form as well as bilinear quadratic and multilinear forms The final two chapters are different being more or less self contained accounts of special topics that explore more advanced aspects of modern algebra tensor fields manifolds and vector calculus in Chapter 4 and matrix Lie groups in Chapter 5 The reader can choose to pursue either chapter Both deal with vast topics in contemporary mathematics They include historical commentary on how modern views evolved as well as examples from geometry and the physical sciences in which these topics are important The book provides a nice and varied selection of exercises examples are well crafted and provide a clear understanding of the methods involved
