Population and Land Use in Developing Countries

National Research Council, Division of Behavioral and Social Sciences and Education, Commission on Behavioral and Social Sciences and Education, Committee on Population, 1993-02-01

This valuable book summarizes recent research by experts from both the natural and social sciences on the effects of population growth on land use. It is a useful introduction to a field in which little quantitative research has been conducted and in which there is a great deal of public controversy. The book includes case studies of African, Asian, and Latin American countries that demonstrate the varied effects of population growth on land use. Several general chapters address the following timely questions: What is meant by land use change? Why are ecological research and population studies so different? What are the implications for sustainable growth in agricultural production? Although much work remains to be done in quantifying the causal connections between demographic and land use changes, this book provides important insights into those connections and it should stimulate more work in this area.

Growing Populations, Changing Landscapes

National Academy of Sciences, Chinese Academy of Sciences, Indian National Science Academy, 2001-06-12. As the world's population exceeds an incredible 6 billion people, governments and scientists everywhere are concerned about the prospects for sustainable development. The science academies of the three most populous countries have joined forces in an unprecedented effort to understand the linkage between population growth and land use change and its implications for the future. By examining six sites ranging from agricultural to intensely urban to areas in transition, the multinational study panel asks how population growth and consumption directly cause land use change and explore the general nature of the forces driving the transformations. *Growing Populations, Changing Landscapes* explains how disparate government policies with unintended consequences and globalization effects that link local land use changes to consumption patterns and labor policies in distant countries can be far more influential than simple numerical population increases. Recognizing the importance of these linkages can be a significant step toward more effective environmental management.

Population, Land Use, and Environment National Research Council, Division of Behavioral and Social Sciences and Education, Center for Economics, Governance, and International Studies, Committee on the Human Dimensions of Global Change, Panel on New Research on Population and the Environment, 2005-10-15. *Population Land Use and Environment: Research Directions* offers recommendations for future research to improve understanding of how changes in human populations affect the natural environment by means of changes in land use such as deforestation, urban development, and development of coastal zones. It also features a set of state-of-the-art papers by leading researchers that analyze population-land-use-environment relationships in urban and rural settings in developed and underdeveloped countries and that show how remote sensing and other observational methods are being applied to these issues. This book will serve as a resource for researchers' research.

Lambin, Helmut J. Geist, 2008-01-08 This book presents recent estimates on the rate of change of major land classes Aggregated globally multiple impacts of local land changes are shown to significantly affect central aspects of Earth System functioning The book offers innovative developments and applications in the fields of modeling and scenario construction Conclusions are also drawn about the most pressing implications for the design of appropriate intervention policies Land-use Change in the Northwestern Uplands of Vietnam Manh-Cuong Pham, 2005 **Sustainable Real Estate in the Developing World** Raymond Talinbe Abdulai, Kwasi Gyau Baffour Awuah, 2021-03-29 Sustainable Real Estate in the Developing World offers a perfect and ideal synthesis of works that examine sustainability within various facets of real estate and urban development in the developing world A must read for academics, researchers, policy makers and students in all the built environment disciplines United States Highway 12, Lake Delton to Sauk City (IH 90/94 to Ski Hi Road), Sauk County, Wisconsin: The report, 2001 **USH-12, Lake Delton to Sauk City (IH 90/94 to Ski Hi Road), Sauk County**, 2004 The Impact of Climate Change on Regional Systems Joel B. Smith, Robert O. Mendelsohn, 2007-01-01 The book works well as a reference for how one can examine potential climate change impacts in a subnational area A clear strength of the work lies in the unifying framework that the climate population and to a somewhat lesser degree urbanization scenarios provide Collectively these appear to bracket a wide range of possible drivers that will shape climate change impacts The overall analysis takes a refreshing approach in that it does not try to fit all these elements and the subsystem impact assessments into one grand integrated model but rather develops the assessments from a common base while allowing each to follow its own logic and scale it provides a welcome overview of how one can conduct a multisystem, multisector climate impact assessment that combines natural engineering and social sciences in a rigorous format Kris Wernstedt Journal of Regional Science Climate scientists have determined that recent global temperature increases are due in large part to increased greenhouse gas emissions from human activities Even if mitigation of these gases begins immediately there is every reason to believe that climate change will continue to occur Every region in the world ought to forecast as the contributors do in this study of California a region of broad variation and high population how it will be affected by climate change and how it might best adapt Models are used to estimate potential physical and biological impacts, efficient adaptations and residual damages from climate change The contributors cover a broad array of climate change impacts on affected market sectors including water supply, agriculture, coastal resources, timber and energy demand as well as ecosystems and biodiversity An integrated hydrologic agriculture model is developed to explore how the

region would adapt to changes in water flows Interactions between climate impacts and population and economic growth urbanization and technological change are also explored For example the study examines how both climate change and projected land development affect the region s terrestrial ecosystems and biodiversity The level of geographical detail along with the broad applicability of the modeling methodology and conclusions make this a unique and valuable reference for environmental economists scientists planners and policymakers
