Theory and Implementation of Economic Models for Sustainable Development J.C. van den Bergh, M.W.

Hofkes, 2013-03-09 There is widespread concern for long term environmental issues in relation to economic processes and developments. Among the concerned scientists are economists who have taken up the challenge to apply economic insights and tools for the study of long term environment economy interactions and to give the concept of sustainable development economic hands and feet. This book presents a pluralistic perspective on efforts, problems and successes in this area. This collection of papers was originally prepared for an international symposium titled Economic Modelling of Sustainable Development Between Theory and Practice which was hosted by the Vrije Universiteit in Amsterdam on December 20th 1996. The main motivation for this symposium was that the usefulness of the concept of sustainable development for theoretical and applied modelling is still being debated. Growth theorists, resource economists, ecological economists, policy makers and many others are trying to deal with the concept in various and sometimes conflicting ways. The aim of the symposium was to bring together different theoretical and implementational perspectives on modelling for sustainable development. We hope that this volume will inform a wide audience about the perspectives and progress in this important area of research as well as stimulate further research, notably on applied modelling and practical methods for the analysis of sustainable development at various spatial scales. The papers have in due course been revised several times based on comments made by discussants, referees and the editors.

Introduction to Modeling Sustainable Development in Business Processes Dirk

Inghels, 2020-11-05 Sustainable development and corporate social responsibility drive countries, regions and businesses to take environmental and social concerns into account when realizing economic objectives. A growing awareness of the connectedness between industrial, societal and environmental systems might shift the way businesses will be operated. This book aims to help students and business practitioners use quantitative modeling in their pursuit to make business processes sustainable. Two approaches are introduced: linear optimization and system dynamics. Moreover, the quantification of the three different sustainability objectives is also addressed. Next to introducing the theoretical background, many real life examples are discussed to demonstrate how the modelling techniques can be applied.

**Innovative Models for Sustainable Development in Emerging African Countries** Niccolò Aste,Stefano Della

Torre, Cinzia Talamo, Rajendra Singh Adhikari, Corinna Rossi, 2019-12-30 This open access book explores key issues and presents recent case studies in areas of importance for the transition to a circular model of development in emerging African countries that will minimize resource consumption and waste production. The topics covered include the development of sustainable housing models, energy and environmental issues in building design and technical systems, recycling for a sustainable future, models for humanitarian emergencies, and low cost and web based digital tools with applications in architecture and archaeology. The aim is to contribute to a necessary paradigm shift with respect to urban planning and usage of territories, moving from a linear urban metabolism based on the take make dispose approach to a circular metabolism. Such a change requires a focus on the relationship between the architectural, urban and physical aspects of new developments, climate and energy demand, as well as the identification and integration of strategies and infrastructures to achieve a high level of efficiency and self sufficiency. The book will appeal to all with an interest in sustainable development in the African context. Sustainable Development of Modern Digital Economy Julia V. Ragulina, Arutyun A.

**Principles of Sustainable Development - Volume I** Giancarlo Barbiroli, 2009-10-20 Principles of Sustainable Development is the component of Encyclopedia of Development and Economic Sciences in the global Encyclopedia of Life Support Systems EOLSS, which is an integrated compendium of twenty one Encyclopedias. Sustainable Development is a term of differing definitions. Standing alone, the term is abstract and ambiguous. The meaning most often cited is that adopted by the World Commission on Environment and Development: meeting today's true needs and opportunities without jeopardizing the integrity of the planetary life support base, the environment, and diminishing its ability to provide for needs, opportunities, and quality of life in the future. This definition may serve as a general principle, but for a guide to action, its components, sustainability and development, must be given substance: what is to be sustained and what developed. Is development essentially economic or material growth, and is sustainability mostly a means to keep economic growth growing? Consequently, should development represent means toward ecologically sustainable ends? The concept of ecological sustainability has been advanced as a restriction on economic development. It follows, therefore, that principles of sustainable development depend upon how the term is understood and how it is put into practice. Even so, the definition of the World Commission on Environment and Development, given the adequate definition of variable needs, provides the most reliable principle for testing the qualitative and ecological sustainability of development proposals. The Theme on Principles of Sustainable Development

in three volumes deals with the diversity of points of view on this complex subject These three volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers and NGOs

A Coming of Age Geospatial Analysis and Modelling in the Early Twenty First Century Forty years ago when spatial analysis first emerged as a distinct theme within geography's quantitative revolution the focus was largely on consistent methods for measuring spatial correlation The concept of spatial autocorrelation took pride of place mirroring concerns in time series analysis about similar kinds of dependence known to distort the standard probability theory used to derive appropriate statistics Early applications of spatial correlation tended to reflect geographical patterns expressed as points The perspective taken on such analytical thinking was founded on induction the search for pattern in data with a view to suggesting appropriate hypotheses which could subsequently be tested In parallel but using very different techniques came the development of a more deductive style of analysis based on modelling and thence simulation Here the focus was on translating prior theory into forms for generating testable predictions whose outcomes could be compared with observations about some system or phenomenon of interest In the intervening years spatial analysis has broadened to embrace both inductive and deductive approaches often combining both in different mixes for the variety of problems to which it is now applied
