Models Of Massive Parallelism:

   Models of Massive Parallelism Max Garzon,2012-12-06 Locality is a fundamental restriction in nature On the other hand adaptive complex systems life in particular exhibit a sense of permanence and time lessness amidst relentless constant changes in surrounding environments that make the global properties of the physical world the most important problems in understanding their nature and structure Thus much of the differential and integral Calculus deals with the problem of passing from local information as expressed for example by a differential equation or the contour of a region to global features of a system s behavior an equation of growth or an area Fundamental laws in the exact sciences seek to express the observable global behavior of physical objects through equations about local interaction of their components on the assumption that the continuum is the most accurate model of physical reality Paradoxically much of modern physics calls for a fundamen tal discrete component in our understanding of the physical world Useful computational models must be eventually constructed in hardware and as such can only be based on local interaction of simple processing elements

distributed computation has been gaining a great lot of attention in the last decades During this period the advances attained in computing and communication technologies and the reduction in the costs of those technolo gies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences Many actual applications have been successfully implemented in various plat forms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures Parallel and distributed computation differs from dassical sequential compu tation in some of the following major aspects the number of processing units independent local dock for each unit the number of memory units and the programming model For representing this diversity and depending on what level we are looking at the problem researchers have proposed some models to abstract the main characteristics or parameters physical components or logical mechanisms of parallel computers The problem of establishing a suitable model is to find a reasonable trade off among simplicity power of expression and universality Then be able to study and analyze more precisely the behavior of parallel applications   *Analog VLSI Integration of Massive Parallel Signal Processing Systems* Peter Kinget,Michiel Steyaert,2013-06-29 When comparing conventional computing architectures to the architectures of biological neural systems we find several striking differences Conventional computers use a low number of high performance computing elements that are programmed with algorithms to perform tasks in a time sequenced way they are very successful in administrative applications in scientific simulations and in certain signal processing applications However the biological systems still significantly outperform conventional computers in perception tasks sensory data processing and motory control Biological systems use a completely dif ferent computing paradigm a massive network of simple processors that are adaptively interconnected and operate in parallel Exactly this massively parallel processing seems the key aspect to their success On the other hand the development of VLSI technologies provide us with technological means to implement very complicated systems on a silicon die Especially analog VLSI circuits in standard digital technologies open the way for the implement at ion of massively parallel analog signal processing systems for sensory signal processing applications and for perception tasks In chapter 1 the motivations behind the emergence of the analog VLSI of massively parallel systems is discussed in detail together with the capabilities and imitations of VLSI technologies and the required research and developments Analog parallel signal processing drives for the development of very com pact high speed and low power circuits An important technologicallimitation in the reduction of the size of circuits and the improvement of the speed and power consumption performance is the device inaccuracies or device mismatch
