

Models of Urban Structure

Concentric zone model

- Central business district
- Factory zone
- Zone of transition
- Zone of working men's homes
- Residential zone
- Commuters' zone

Land use is arranged in a series of concentric rings or zones around the city centre. The idea is that the city has grown outward in all directions from the centre, adding new buildings around the edges. The process is rather like the growth rings of trees. It means that the urban fabric should get older towards the centre. The width of the zones varies according to the density of building.

Sector model

- Central business district
- Wholesale light manufacturing
- Low-class residential
- Medium-class residential
- High-class residential

Land use is arranged in wedges or sectors which radiate from the city centre. Growth follows a linear pattern along major transport routes or physical features such as river valleys. We assume that once a particular type of land use establishes itself in an area, it attracts similar activities (like industry) and repels dissimilar ones (like high-status housing).

Multiple nuclei model

- Central business district
- Wholesale and light manufacturing
- Low-class residential
- Medium-class residential
- High-class residential
- Heavy manufacturing
- Outlying business district
- Industrial suburb

Distinctive land uses form small areas or nuclei such as the central business district, housing estates, industrial estates, and office and retail parks. Often similar activities/types of land use benefit from being clustered together.

Geospatial Analysis and Modelling of Urban Structure and Dynamics Bin Jiang,Xiaobai Yao,2010-06-16 A Coming of Age Geospatial Analysis and Modelling in the Early Twenty First Century Forty years ago when spatial analysis first emerged as a distinct theme within geography's quantitative revolution the focus was largely on consistent methods for measuring spatial correlation The concept of spatial autocorrelation took pride of place mirroring concerns in time series analysis about similar kinds of dependence known to distort the standard probability theory used to derive appropriate statistics Early applications of spatial correlation tended to reflect geographical patterns expressed as points The perspective taken on such analytical thinking was founded on induction the search for pattern in data with a view to suggesting appropriate hypotheses which could subsequently be tested In parallel but using very different techniques came the development of a more deductive style of analysis based on modelling and thence simulation Here the focus was on translating prior theory into forms for generating testable predictions whose outcomes could be compared with observations about some system or phenomenon of interest In the intervening years spatial analysis has broadened to embrace both inductive and deductive approaches often combining both in different mixes for the variety of problems to which it is now applied
