Reproducing Kernel Pontryagin Spaces Daniel Alpay, Aad Dijkma, James Rovnyak, Hendrik de Snoo, 2012-12-06

Generalized Schur functions are scalar or operator valued holomorphic functions such that certain associated kernels have a finite number of negative squares This book develops the realization theory of such functions as characteristic functions of coisometric isometric and unitary colligations whose state spaces are reproducing kernel Pontryagin spaces This provides a modern system theory setting for the relationship between invariant subspaces and factorization operator models Krein Langer factorizations and other topics The book is intended for students and researchers in mathematics and engineering An introductory chapter supplies background material including reproducing kernel Pontryagin spaces complementary spaces in the sense of de Branges and a key result on defining operators as closures of linear relations The presentation is self contained and streamlined so that the indefinite case is handled completely parallel to the definite case *Topics In*

 we have attended a working conference on Computer Aided Tomography and Ultrasonics in Medicine which was held in
 Haifa Israel under the auspices of the International Federation for Information Processing 1 That meeting in common with
 other meetings relating to computerized tomography concentrated on the physical engineering and clinical aspects of the
 topic with little attention paid to the underlying mathematics and no attention paid to recent developments in mathematics
 inspired by computerized tomography although not necessarily useful for computerized tomography We both felt that it
 would be worthwhile to organize a meeting of mathematicians which would concentrate on the mathematical aspects of
 computerized tomography This volume and the meeting on which it is based is the outcome of our decision in August 1978 to
 attempt to bring together such a meeting In the meantime much has been published on the topic of computerized to

Ran,2012-12-06 This volume contains a selection of papers in modern operator theory and its applications Most of them are directly related to lectures presented at the Inter national Workshop on Operator Theory and its Applications held at the University of Groningen IWOTA 98 in Groningen the Netherlands from June 30 July 3 1998 The workshop was attended by 97 mathematicians of which 12 were PhD or postdoctoral students from 19 countries The program consisted of 19 plenary lectures of 40 minutes and 72 lectures of 30 minutes in 4 parallell sessions The present volume reflects the wide range and rich variety of topics presented and discussed at the workshop The papers deal with operator polynomials and analytic operator functions with spectral problems of partial differential oper ators and related operator matrices with interpolation completion and extension problems with commutant lifting and dilation with Ricatti equations and real ization problems with scattering theory with problems from harmonic analysis and with topics in the theory of reproducing kernel spaces and of spaces with an indefinite metric All papers underwent the usual refereeing process

Mathematical Reviews ,2003-05 *Topics in Interpolation Theory* Bernd Fritzsche,Victor Katsnelson,Bernd Kirstein,2012-12-06 About one half of the papers in this volume are based on lectures which were pre sented at a conference at Leipzig University in August 1994 which was dedicated to Vladimir Petrovich Potapov He would have been eighty years old These have been supplemented by 1 Historical material based on reminiscences of former colleagues students and associates of V P Potapov 2 Translations of a number of important papers which serve to clarify the Potapov approach to problems of interpolation and extension as well as a number of related problems and methods and are relatively unknown in the West 3 Two expository papers which have been especially written for this volume For purposes of discussion it is convenient to group the technical papers in this volume into six categories We will now run through them lightly first listing the major theme then in parentheses the authors of the relevant papers followed by discussion Some supplementary references are listed at the end OT72 which appears frequently in this volume refers to Volume 72 in the series Operator Theory Advances and Applications It was dedicated to V P Potapov 1 Multiplicative decompositions Yu P Ginzburg M S Livsic I V Mikhailova V I Smirnov **Series in Banach Spaces** Vladimir Kadets,2012-12-06 Series of scalars vectors or functions are among the fundamental objects of mathematical analysis When the arrangement of the terms is fixed investigating a series amounts to investigating the sequence of its partial sums In this case the theory of series is a part of the theory of sequences which deals with their convergence asymptotic behavior etc The specific character of the theory of series manifests itself when one considers rearrangements permutations of the terms of a series which brings combinatorial considerations into the problems studied The phenomenon that a numerical series can change its sum when the order of its terms is changed is one of the most impressive facts encountered in a university analysis course The present book is devoted precisely to this aspect of the theory of series whose terms are elements of Banach as well as other topological linear spaces The exposition focuses on two

complementary problems The first is to characterize those series in a given space that remain convergent and have the same sum for any rearrangement of their terms such series are usually called unconditionally convergent The second problem is when a series converges only for certain rearrangements of its terms in other words converges conditionally to describe its sum range i.e. the set of sums of all its convergent rearrangements

Control and Inverse Problems Kaïs Ammari, Chaker Jammazi, Faouzi Triki, 2023-09-26 This volume presents a timely overview of control theory and inverse problems and highlights recent advances in these active research areas The chapters are based on talks given at the spring school Control Inverse Problems held in Monastir Tunisia in May 2022 In addition to providing a snapshot of these two areas chapters also highlight breakthroughs on more specific topics such as Controllability of dynamical systems Information transfer in multiplier equations Nonparametric instrumental regression Control of chained systems The damped wave equation Control and Inverse Problems will be a valuable resource for both established researchers as well as more junior members of the community
