Stochastic Population Dynamics in Ecology and Conservation Russell Lande, Steinar Engen, Bernt-Erik Sæther, 2003 All populations fluctuate stochastically creating a risk of extinction that does not exist in deterministic models with fundamental consequences for both pure and applied ecology This book provides the most comprehensive introduction to stochastic population dynamics combining classical background material with a variety of modern approaches including new and previously unpublished results by the authors illustrated with examples from bird and mammal populations and insect communities Demographic and environmental stochasticity are introduced with statistical methods for estimating them from field data The long run growth rate of a population is explained and extended to include age structure with both demographic and environmental stochasticity Diffusion approximations facilitate the analysis of extinction dynamics and the duration of the final decline Methods are developed for estimating delayed density dependence from population time series using life history data Metapopulation viability and the spatial scale of population fluctuations and extinction risk are analyzed Stochastic dynamics and statistical uncertainty in population parameters are incorporated in Population Viability Analysis and strategies for sustainable harvesting Statistics of species diversity measures and species abundance distributions are described with implications for rapid assessments of biodiversity and methods are developed for partitioning species diversity into additive components Analysis of the stochastic dynamics of a tropical butterfly community in space and time indicates that most of the variance in the species abundance distribution is due to ecological heterogeneity among species so that real communities are far from neutral

Minimum Animal Populations Hermann Remmert, 2012-12-06 H REMMERT Small populations are very often discussed but there seems to be no general overview touching all the self evident but normally simply neglected problems connected with small populations First there are many very different types of organisms and as every biologist should know the problems of small populations are very different in different types of organisms 1 In vascular plants the problems are different from the situation in birds and mammals in marine benthic animals or in parasites such as tapeworms the problems are different again and in seasonal planktonic animals or insects they are different from those in biotopes under constant conditions In tapeworms or in vascular plants an adult organism seems to be comparable to a population of mammals or birds because its offspring can be so diverse and plentiful 2 There are small populations which explode and break down to a small population again and then explode and break down again
