

in *Conrad Younger*," Section IV). Mortality rate is, of course, one of the basic dynamic characteristics of populations (along with migration and fertility), while the age of a population is one of its structural or compositional characteristics, so we have in this paper a clear illustration of demographic analysis (some writers have called this formal demography).

By contrast, population studies are those that examine the influence of some non-demographic characteristic on a demographic variable (such as migration, mortality, fertility, age structure). As Hanner indicates, the non-demographic characteristics may come from a variety of other "systems of variables," so that two quite different independent variables might be employed to explain variations in the same demographic variable. As a sample illustration, differences in fertility or changes in fertility may be explained by differences in family structure or marriage customs (sociological variables), fears and stereotypes about birth-control techniques (psychological variables), differences in fecundity (a biological variable—fecundity is defined as the biological capacity to reproduce and is probably influenced by such things as diet, health, heredity, etc.).

Hanner, in this introductory paper, notes that non-demographers may also use demographic factors in their studies. The non-demographer may use a population factor as an independent variable to show the influence that it may have on a non-demographic variable. For example, a political scientist could examine the age structure of a population to determine what effect it might have on the voting behavior of the group. Strictly speaking, this is not demography, but for convenience we may consider it one kind of population study. We might then have population studies type I, where other systems of variables are used to explain variations in demographic variables, and population studies type II, where demographic variables are used to explain variations in other systems of variables.

Following these distinctions, it will be clear that we have treated toward the selection of these articles that would be labeled population study type I, and have chosen papers where the independent variables most often come from the social and cultural realm, sometimes from the psychological realm.

In his paper on the relationship between sociology and demography, Hanner gives us the emphasis "that there is no logical reason why demography should be more closely related to sociology than to

Malthus's Essay on the Principle of Population has for the past two centuries been a constant source of inspiration and debate for scholars working on relationships between population and economy in historical perspective. This book of collected essays is an outcome of an A session held at the 12th International Congress of Economic History in Madrid 1998, setting a new standard in this active and influential field of research. The contributors go beyond the conventional European and North American geographical boundaries, bringing out new empirical findings and developing new arguments. The volume is divided into three parts. The first section takes up classical issues: the positive and the preventive checks and their determinants raised by Malthus himself, and examines the issues against fresh evidence from Europe, America, and Asia. These issues are also themes of the second part, devoted to short-term fluctuations in mortality and fertility in relation to prices, wages, and other economic indicators. The final set of chapters is a coherent collection of technically sophisticated articles from an ongoing international joint project concerned with how households respond to economic stress in different economic, social, and cultural settings in traditional China, Japan, Sweden, Belgium, and Italy. With a brief but well-organized introduction, this collection of scholarly essays offers both demographers and economic historians a wealth of exciting findings and stimulating insights.

**Classical Political Economy** William O. Thweatt, 2013-03-09. William O. Thweatt. This book is the second in three surveys of the literature in the history of economic thought in the Kluwer Recent Economic Thought series. The first book, covering the pre-classical literature, has already been published; a third, on the neo-classical period, is planned for 1988. This middle book surveys the writings on classical political economy for the past 30 years, or roughly since the publication of Joseph Schumpeter's 1954 monumental *History of Economic Analysis*. Shortly after World War II, the American Economic Association sponsored a Survey of Contemporary Economics, 1949. That work covered 13 subdisciplines of economics, and in 1952 a companion piece appeared in which surveys of 10 additional subdisciplines were presented. As Bernard Haley, editor of the second volume, stated even though in the two volumes twenty-three fields have been treated, there remain some aspects of the subject that have not been reviewed.
