Task-Based Language Learning in a Real-World Digital Environment Paul Seedhouse,2017-02-09

How can you use the latest digital technology to create an environment in which people can learn European languages while performing a meaningful real world task and experiencing the cultural aspect of learning to cook European dishes This book explains how to do this from A to Z covering how a real world digital environment for language learning was designed built and researched The project makes language learning motivational and fun by tapping into people s interest in both cooking and technology you can learn a language while cooking and interacting with a speaking digital kitchen The kitchens provide spoken instructions in the foreign language on how to prepare European cuisine Digital sensors are inserted in or attached to

all the kitchen equipment and ingredients so the digital kitchen detects what learners are doing and gives them feedback. Learners are also able to communicate with the kitchens and can ask for help via photos and videos if they don't understand any foreign language words. Based on two research grants, the book provides five research studies showing the learning experiences of users in five European countries. The book explains the principles and procedures involved in the project enabling others to design and implement a real world digital learning environment in the same way. It includes numerous photographs of the system in use and evidence of how and what 250 users actually learnt.

Siahaan, Rismon Hasiholan Sianipar, 2024-03-27

The first project in chapter one, which is Canny Edge Detector, presented here is a graphical user interface (GUI) application built using Tkinter in Python. This application allows users to open video files of formats like mp4, avi, or mkv and view them along with their corresponding Canny edge detection frames. The application provides functionalities such as playing, pausing, stopping, navigating through frames, and jumping to specific times within the video. Upon opening the application, users are greeted with a clean interface comprising two main sections: the video display panel and the control panel. The video display panel consists of two canvas widgets: one for displaying the original video and another for displaying the Canny edge detection result. These canvases allow users to visualize the video and its corresponding edge detection in real time. The control panel houses various buttons and widgets for controlling the video playback and interaction. Users can open video files using the "Open Video" button, select a zoom scale for viewing, conveniently jump to specific times within the video, play, pause, stop the video, navigate through frames, and even open another instance of the application for simultaneous use. The core functionality lies in the methods responsible for

displaying frames and performing Canny edge detection The `show_frame` method retrieves frames from the video resizes them based on the selected zoom scale and displays them on the original video canvas Similarly the `show_canny_frame` method applies the Canny edge detection algorithm to the frames enhances the edges using dilation and displays the resulting edge detection frames on the corresponding canvas The application also supports mouse interactions such as dragging to pan the video frames within the canvas and scrolling to navigate through frames These interactions are facilitated by event handling methods like `on_press` `on_drag` and `on_scroll` ensuring smooth user experience and intuitive control over video playback and exploration Overall this project provides a user friendly platform for visualizing video content and exploring Canny edge detection results making it valuable for educational purposes research or practical applications involving image processing and computer vision
