Real Time Ultrasonography:

Ultrasonography of the Neck Jean-Noel Bruneton, 2012-12-06 Owing to the anatomic complexity of the neck and the diversity of pathologic entities affecting it the cervical region has long been of great semiological interest Physical examination is an easy means of evaluating the size and origin of a solitary cervical mass yet valid interpretation can prove difficult when the normal morphology of the neck has been altered excellent examples are patients with extensive fibrosis or scarring secondary to previous irradiation or surgery Like wise physical examination cannot assess the relations of a pathologic process to adjacent structures e g invasion can not be distinguished from simple displacement and it is unsuitable for monitoring therapeutic efficacy such as the response of metastatic nodes to medical management Between physical examination which remains fundamental and exploratory surgical procedures which are often the only means of obtaining indispensable anatomic proof for diagnosis lie a number of recent imaging techniques including computed tomography and magnetic resonance imaging using surface coils that provide invaluable information for the investigation of cervical pathologies Real time ultrasonography occupies a privileged position because of its noninvasiveness rapidity and reliability especially when performed by a specially trained examiner
