Recent Developments In High Temperature Superconductivity:

Recent Developments in High Temperature Superconductivity Jan Klamut, 1996-09-17 This book contains review articles presenting the current status of high temperature superconductivity research. The articles cover synthesis, issues, materials properties, and most fundamental theoretical problems. Applications of high temperature superconductors are also reflected in several contributions. The book addresses researchers working in fundamental research in solid state physics as well as engineers developing new materials for industrial applications.

Recent Developments in Superconductivity Research Barry P. Martins, 2007 Superconductivity is the ability of certain materials to conduct electrical current with no resistance and extremely low losses. High temperature superconductors such as $\text{La}_{2-x}\text{Sr}_x\text{CuO}_x$ (T_c 40K) and $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ (T_c 90K) were discovered in 1987 and have been actively studied since. In spite of an intense world wide research effort during this time a complete understanding of the copper oxide cuprate materials is still lacking. Many fundamental questions are unanswered particularly the mechanism by which high T_c superconductivity occurs. More broadly the cuprates are in a class of solids with strong electron-electron interactions. An understanding of such strongly correlated solids is perhaps the major unsolved problem of condensed matter physics with over ten thousand researchers working on this topic. High T_c superconductors also have significant potential for applications in technologies ranging from electric power generation and transmission to digital electronics. This ability to carry large amounts of current can be applied to electric power devices such as motors and generators and to electricity transmission in power lines. For example superconductors can carry as much as 100 times the amount of electricity of ordinary copper or aluminium wires of the same size. Many universities, research institutes and companies are working to develop high T_c superconductivity applications and considerable progress has been made. This volume brings together new leading edge research in the field.

Advances in Superconductivity XII T. Yamashita, K. Tanabe, 2013-11-11 The 12th International Symposium on Superconductivity was held in Morioka, Japan, October 17-19, 1999. Convened annually since 1988, the symposium covers the whole field of superconductivity from fundamental physics and chemistry to a variety of applications. At the 12th Symposium a mini symposium focusing on the two dimensionality of high temperature superconductors or the c axis transport and a session on vortex physics were organized. There were also many reports on the recent developments of YBCO based coated conductors both in the United States and in Japan. AC losses of wires and tapes, developments of bulk materials with strong flux pinning, the recent progress in thin film and junction technologies and the demonstration of various electronics applications using SQUIDS, microwave devices and single flux quantum (SFQ) digital devices. This volume is a valuable resource for all those working in the field of superconductivity.

Kozo Osamura, Izumi Hirabayashi, 2013-11-11 The International Symposium on Superconductivity which has been held annually since 1988 is a forum for presenting the most up to date information about a broad range of research and development in superconductivity from fundamental aspects to applications More than 10 years have passed since the discovery of oxide superconductors and since various developments of applications began It may be said that the prospects for application of oxide superconductors recently have opened up Great progress has been made toward practical use for example of the flywheel which uses bulk materials and the high performance cryo cooled magnet made of bismuth wire These were the results of persistent efforts to develop materials from the viewpoint of materials science and engineering Also important is the progress in comprehensive understanding of high temperature superconductivity Unique electronic properties of

cuprates such as the non Fermi liquid normal state spin charge separation spin gap and d wave symmetry were discussed at the symposium as were the unique electromagnetic properties resulting from the low dimensionality of cuprates In the field of new superconductors many exotic materials have been discovered since 1986 A decade of work with cuprate superconductors is reviewed in this proceedings and several of the newest materials are presented These papers will be instructive for many researchers and for students who are to enter this field

commercialization and basic research on the properties of superconductive materials Recent progress in areas such as bulk single crystal production long scale wire and tape production flywheel and bearing applications and electronic device applications for thin films indicate that science and technology have been working hand in hand in this field as has been the case in the research and development of semi conductors This interdisciplinary resonance will be certain to lead to further outstanding advances in the years to come It goes without saying that worldwide information exchange is the key to accelerating progress in superconductivity science and technology As in previous years the ISS 93 served as a venue where visions of future developments were shared in addition to presentations and extensive discussions on the most up to date research results I hope that the Proceedings contained in this volume will be consulted not only as a summary of the current state of the art in high T_c superconductivity but also as a stimulating source of ideas regarding future applications of superconductivity research

The New Superconducting Electronics H. Weinstock, Richard W. Ralston, 2012-12-06 This volume is based on the proceedings of the NATO sponsored Advanced Studies Institute ASn on The New Superconducting Electronics held 9-20 August 1992 in Waterville Valley New Hampshire USA The contents herein are intended to provide an update to an earlier volume on the same subject based on a NATO ASI held in 1988 Four years seems a relatively short time interval and our title itself featuring The New Superconducting Electronics may appear somewhat pretentious Nevertheless we feel strongly that the ASI fostered a timely reexamination of the technical progress and application potential of this rapid paced field There are indeed many new avenues for technological innovation which were not envisioned or considered possible four years ago The greatest advances by far have occurred with regard to oxide superconductors the so called high transition temperature superconductors known in short as HTS These advances are mainly in the ability to fabricate both 1 high quality relatively large area films for microwave filters and 2 multilayer device structures principally superconducting normal superconducting SNS Josephson junctions for superconducting quantum interference device SQUID magnetometers Additionally we have seen the invention and development of the flux flow transistor a planar three terminal device During the earlier ASI only the very first HTS films with adequate critical current density had just been fabricated and these were of limited area and had high resistance for microwave current
