Progress in Optics ,1992-06-26 Confirming the fact that optics continues to be a highly active field of research where many interesting developments are currently taking place the latest volume in this renowned series presents five review articles by well known experts on topics of current interest in optics The first article concerns quantum fluctuations a phenomenon encountered directly or indirectly in all optical measurements Such fluctuations set limits to attainable accuracy with which measurements can be made In recent years

theoretical as well as experimental research has demonstrated that limitations arising from quantum fluctuations can sometimes be circumvented to some extent. These developments are of importance from the standpoint of basic physics as well as in connection with technological applications such as noise reduction in communication systems. The second article deals with correlation holographic interferometry and speckle photography paying special attention to the effects of random variation of surface microstructure on the contrast of interference fringes. The article which follows covers an important subject in the broad area of wave propagation in random media namely wave localization. This phenomenon is a subtle manifestation of interference of multiply scattered waves and provides information about important properties of disordered systems. The article considers mainly localization in one dimensional systems which elucidate some of the underlying physics. The fourth article discusses an important nonlinear phenomenon namely soliton propagation in fibres. Solitons are pulses which can propagate over long distances without change in shape. Because of their considerable stability they are of particular interest for communication systems. The concluding article presents the theory and describes experiments on elementary quantum systems in the context of cavity quantum optics. Such experiments are providing deeper understanding of the interaction of light with matter and give new insights into the foundations of quantum mechanics.

Recent Advances in Metrology and Fundamental Constants T.J. Quinn, S. Leschiutta, 2001-12-18. The exchange between physics and metrology is always fascinating and exciting. Many are the open problems in physics that call for extremely precise standards; many are the advances in metrology made possible by a deep and assiduous study of the underlying physics. One has just to think of the enormous sophistication required in the measurements of some absolute quantities such as the Avogadro number, the gas constant or the gravitational constants. It is also worth noticing that not only the units of a metrological system are interrelated through the fundamental constants but also the latter find their full significance when they are determined through the most exacting metrological experiments. Over the past decade many improvements took place and these are discussed in this book from one side the old caesium SI second definition has found a new realisation with the fountain approach replacing the classical thermal atomic beam. The use of cold atom techniques in which bunches of inert atoms are collected, slowed down and cooled has opened a number of new and unexpected avenues for metrology and fundamental constants; one of these possibilities being the atom interferometry. Another important quantum jump was the demonstration of the possibility of performing a direct frequency division in the visible using ultra short femtosecond pulses. In addition the possibility of counting electrons or photons gave a fundamental support to the development of single electron capacitance standards and to new scenarios in the absolute calibration of photo detectors.

Progress in Optics Emil Wolf, 2001-12-17. This volume presents six review articles devoted to various topics of current interest both in classical and in quantum optics. The first article by S. Ya. Kilin entitled *Quanta and Information* is concerned with a multidisciplinary subject which involves optics, information theory, programming and discrete mathematics. The second article *Optical Solitons in Periodic Media with Resonant and Off*

Resonant Nonlinearities by G Kurizki A E Kozhekin T Optatrný and B Malomed reviews the properties of optical solitons in periodic nonlinear media The article which follows deals with an effect and its inverse which is a manifestation of hindrance and enhancement respectively of the evolution of a quantum system by an external agent such as a detection apparatus The fourth article discusses the current status of a relatively new branch of physical optics sometimes called singular optics The next two articles respectively present a review of advances in two photon interferometry and their relation to investigations of the foundations of quantum theory and an examination of transverse mode shaping and selection in laser resonators
