

Methods to Assess Quality and Stability of Oils and Fat-containing Foods

Edited by Kathleen Warner and NCA. Michael Iddis, AOCS Press, 1995. \$60.00-HK + 220 pages. ISBN 0 9033115 58 8

The monograph *Methods to Assess Quality and Stability of Oils and Fat-containing Foods* is based on an American Oil Chemists Society short course held in 1991. Unfortunately, it took approximately four years for this book to be published; thus, very few scientists published after 1991 have been cited. Several important recent developments in the field, such as the use of chemiluminescence and electron paramagnetic resonance to monitor lipid oxidation, have not been mentioned in this volume.

However, as stated by the editors, this monograph was written for those laboratory scientists who are establishing protocols to determine oil quality and stability. In this regard, the editors have accomplished their goal.

The book consists of 11 chapters. An interesting historical review of the developments in methods of fat analysis and sensory evaluation from the 1880s to the 1970s is presented in Chapter 1. Chapter 2 provides a good review of the factors affecting oil quality and stability. A very comprehensive treatment of sensory analysis

of oils and fat-containing foods is given in Chapters 3–5. Because sensory analysis is the optimum tool for the quality of oils and fat-containing foods, a detailed discussion on this subject is certainly desirable.

In Chapters 6 and 7, the significant volatile flavor compounds in oils and fat-containing foods, and the methods to measure these volatile compounds are discussed; emphasis has been placed on the volatile compounds in vegetable oils – marine oils have not been mentioned. All of the sample preparation methods for gas chromatographic analysis, including direct injection, static headspace and dynamic headspace have been discussed. Readers should, however, be aware of the recent developments in the use of adsorptive-stripping direct desorb thermal desorption or direct short-path thermal desorption gas chromatography for the measurement of volatiles. Gas chromatography/olfactometry (GC/O) including the 'chum' method or aroma extract dilution analysis, is another important recent development that will be

particularly useful in determining the compound or compounds responsible for the off-flavor of oils and fat-containing foods; however GC/O is not mentioned in this monograph.

Chemical methods, such as peroxide value, conjugated diene, anisidine value and rancidity value analyses, for the measurement of oil quality are well presented in Chapters 8 and 9. Various accelerated stability tests including the active-oxygen method and the Rancimat method are discussed in Chapter 10. The advantages and disadvantages for various tests are briefly but clearly discussed. The most valuable and unique contribution to this volume is probably Chapter 11: J.C. Nibbelk, the editor of this chapter, has certainly accomplished his goal of making the reader a more 'intelligent consumer' of statistics.

In summary, *Methods to Assess Quality and Stability of Oils and Fat-containing Foods* provides valuable information on methods for assessing the quality and stability of oils and fat-containing foods. It is recommended to industrial laboratory scientists in quality control and product development who are concerned with the determination of oil quality and stability.

Food Enzymes: Structure and Mechanisms

by Franklin W.S. Wong, Chapman & Hall, 1995. 624 pp. ISBN 0 412 05691 7

Food Enzymes: Structure and Mechanisms attempts to bring together detailed, fully referenced information about the structure and function of enzymes on the one hand, and their application to food processing on the other.

The volume begins with a very brief review of the current range of enzyme uses in the food manufacturing and processing sector. This is augmented by some comments on future developments such as recombinant DNA technology, gene engineering and monoclonal antibodies. This chapter lacks balance and substance in that no consideration is given to economic, regulatory or consumer acceptance issues. Also, the author dwells too much on catalytic antibodies and artificial enzymes, the potential of which

in the food area is doubtful and very far downstream. In a book dealing with the food manufacturing sector, a more useful and relevant area to describe and describe would have been the growing fundamental and applied literature on the modification and exploitation of enzyme behaviour in solvent-free food systems^{1,2}, which has been ignored completely.

The second chapter is on 'tailor made' enzyme mixtures and functions and gives a brief introduction to the advantages of modified enzymes, with inadequate critical appraisal of the special needs of the food processing sector, dealing as it does in relatively low added-value bulk materials, which people expect to be safe to eat. However, such criticism apart, this chapter gives a rational and generally

well informed account of the scientific basis of protein modification, based on the principles of engineering molecular interactions in order to influence stability, resistance to chemical modification, catalytic efficiency and bond specificity.

The bulk of the book is taken up with very comprehensive chapters describing, at a detailed biochemical and molecular level, the structure, characteristics and action mechanisms of the major classes of enzymes used in food processing. Those readers who are attracted to the food aspect of the book's title will be disappointed by the lack of information on the relevance of these details to food modification, processing and preservation technology. However, it will appeal to research and development scientists searching for opportunities to use fundamental knowledge as an integral part of results-oriented R&D programmes.

The enzymes covered are amylases, cellulases, crosslinkers (although
