Phonological Parsing In Speech Recognition:

Phonological Parsing in Speech Recognition K. Church, 2012-12-06 It is well known that phonemes have different acoustic realizations depending on the context Thus for example the phoneme t is typically realized with a heavily aspirated strong burst at the beginning of a syllable as in the word Tom but without a burst at the end of a syllable in a word like cat Variation such as this is often considered to be problematic for speech recognition 1 In most systems for sentence recognition such modifications must be viewed as a kind of noise that makes it more difficult to hypothesize lexical candidates given an input phonetic transcription To see that this must be the case we note that each phonological rule in a certain example results in irreversible ambiguity the phonological rule does not have a unique inverse that could be used to recover the underlying phonemic representation for a lexical item For example schwa vowels could be the first vowel in a word like about or the surface realization of almost any English vowel appearing in a sufficiently destressed word The tongue flap could have come from a t or a d 65 pp 548 549 This view of allophonic variation is representative of much of the speech recognition literature especially during the late 1970 s One can find similar statements by Cole and Jakimik 22 and by Jelinek 50

The Integration of Phonetic Knowledge in Speech Technology William J. Barry, William John Barry, Willem A. van Dommelen, 2006-03-31 Continued progress in Speech Technology in the face of ever increasing demands on the performance levels of applications is a challenge to the whole speech and language science community Robust recognition and understanding of spontaneous speech in varied environments good comprehensibility and naturalness of expressive speech synthesis are goals that cannot be achieved without a change of paradigm This book argues for interdisciplinary communication and cooperation in problem solving in general and discusses the interaction between speech and language engineering and phonetics in particular With a number of reports on innovative speech technology research as well as more theoretical discussions it addresses the practical scientific and sometimes the philosophical problems that stand in the way of cross disciplinary collaboration and illuminates some of the many possible ways forward Audience Researchers and professionals in speech technology and computational linguists

Robustness in Automatic Speech Recognition Jean-Claude Junqua, Jean-Paul Haton, 2012-12-06 Foreword Looking back the past 30 years we have seen steady progress made in the area of speech science and technology I still remember the excitement in the late seventies when Texas Instruments came up with a toy named Speak and Spell which was based on a VLSI chip containing the state of the art linear prediction synthesizer This caused a speech technology fever among the electronics industry Particularly applications of automatic speech recognition were rigorously attempted by many companies some of which were start ups founded just for this purpose Unfortunately it did not take long before they realized that automatic speech recognition technology was not mature enough to satisfy the need of customers The fever gradually faded away In the meantime constant efforts have been made by many researchers and engineers to improve the automatic speech recognition technology Hardware capabilities have advanced

impressively since that time In the past few years we have been witnessing and experiencing the advent of the Information Revolution What might be called the second surge of interest to commercialize speech technology as a natural interface for man machine communication began in much better shape than the first one With computers much more powerful and faster many applications look realistic this time However there are still tremendous practical issues to be overcome in order for speech to be truly the most natural interface between humans and machines

Time Map Phonology J.

Carson-Berndsen,2013-03-14 This book is a revised version of my doctoral thesis which was submitted in April 1993 The main extension is a chapter on evaluation of the system described in Chapter 8 as this is clearly an issue which was not treated in the original version This required the collection of data the development of a concept for diagnostic evaluation of linguistic word recognition systems and of course the actual evaluation of the system itself The revisions made primarily concern the presentation of the latest version of the SILPA system described in an additional Subsection 8 3 the development environment for SILPA in Section 8 4 the diagnostic evaluation of the system as an additional Chapter 9 Some updates are included in the discussion of phonology and computation in Chapter 2 and finite state techniques in computational phonology in Chapter 3 The thesis was designed primarily as a contribution to the area of computational phonology However it addresses issues which are relevant within the disciplines of general linguistics computational linguistics and in particular speech technology in providing a detailed declarative computationally interpreted linguistic model for application in spoken language processing Time Map Phonology is a novel constraint based approach based on a two stage temporal interpretation of phonological categories as events

Laboratory Phonology 7

Carlos Gussenhoven,Natasha Warner,2008-08-22 This collection of recent papers in Laboratory Phonology approaches phonological theory from several different empirical directions Psycholinguistic research into the

perception and production of speech has produced results that challenge current conceptions about phonological structure. Field work studies provide fresh insights into the structure of phonological features and the phonology phonetics interface is investigated in phonetic research involving both segments and prosody while the role of underspecification is put to the test in automatic speech recognition.

Dynamics of Speech Production and Perception P.L. Divenyi, S. Greenberg, G. Meyer, 2006-09-20 The idea that speech is a dynamic process is a tautology whether from the standpoint of the talker the listener or the engineer speech is an action a sound or a signal continuously changing in time Yet because phonetics and speech science are offspring of classical phonology speech has been viewed as a sequence of discrete events positions of the articulatory apparatus waveform segments and phonemes Although this perspective has been mockingly referred to as beads on a string from the time of Henry Sweet's 19th century treatise almost up to our days specialists of speech science and speech technology have continued to conceptualize the speech signal as a sequence of static states interleaved with transitional elements reflecting the quasi continuous nature of vocal production This book a collection of papers of which each looks at speech as a dynamic process and highlights one of its particularities is dedicated to the memory of Ludmilla Andreevna Chistovich At the outset it was planned to be a Chistovich festschrift but sadly she passed away a few months before the book went to press The 24 chapters of this volume testify to the enormous influence that she and her colleagues have had over the four decades since the publication of their 1965 monograph

Phonology Charles W. Kreidler, 2001 Phonology Critical Concepts the first such anthology to appear in thirty years and the largest ever published brings together over a hundred previously published book chapters and articles from professional journals These have been chosen for their importance in the exploration of theoretical questions with some preference for essays that are not easily accessible Divided into sections each part is preceded by a brief introduction which aims to point out the problems addressed by the various articles and show their relations to one another

Phonology Jonathan Kaye, 2013-03-07 Designed to acquaint the reader with the field of phonology the study of the systems of linguistically significant sounds this book begins with a brief introduction to linguistics and a discussion of phonology's place within that field It then goes on to cover a variety of topics including the nature of phonological units phonological rules which types of phenomena interest phonologists and the evolution of phonological theory Suitable for many applications this volume assumes no previous knowledge of linguistics An excellent text for use in first or second year phonology courses it will also be of value to those involved in cognitive science neuroscience artificial intelligence and computer science

Phonological Knowledge Noel Burton-Roberts, Philip Carr, Gerard Docherty, 2000-12-21 Phonological Knowledge addresses central questions in the foundations of phonology and locates them within their larger linguistic and philosophical context Phonology is a discipline grounded in observable facts but like any discipline it rests on conceptual assumptions This book investigates the nature status and acquisition of phonological knowledge it enquires into the conceptual and empirical foundations of phonology and considers the relation of phonology to the theory of language and other capacities of mind The authors address a wide range of interrelated questions the most central of which is this is phonological knowledge different from linguistic knowledge in general They offer responses to this question from a variety of perspectives each of which has consequences for how phonology and language are conceived Each also involves a host of further questions concerning the modularity of mind and of language whether phonology should be included in the language faculty the nature convention debate the content of phonological elements and its relation to phonetic substance the implications of sign languages for phonology whether functional and variationist considerations are relevant in phonology how phonological knowledge arises and not least the data and methods appropriate for phonological inquiry Phonological Knowledge is an important contribution to the most fundamental issues in phonology and the understanding of language It will interest researchers in and advanced students of phonology linguistic theory and philosophy of language In addition to the editors the authors are Mary Beckman Silvain Bromberger Jennifer Fitzpatrick Paul Foulkes Mark Hale Morris Hall John Harris Harry van der Hulst Robert Ladd G Lindsey Scott Myers Janet Pierrehumbert Charles Reiss Shelley Velleman Marilyn Vihman and Linda Wheeldon By relating foundational questions of phonology to their larger linguistic cognitive and philosophical contexts this book will generate interest not only among phonologists and their advanced students but also among all those concerned to understand the forms and functions of language
