## Photoelectricity Its Apps:

Photoelectric Properties and Applications of Low-Mobility Semiconductors Rolf Könenkamp, 2003-07-01 This volume discusses the photoelectric behavior of three semiconducting thin film materials hydrogenated amorphous silicon a Si H nano porous titanium dioxide and the fullerene C60 Despite the fundamental structural differences between these materials their electronic properties are at least on the phenomenological level surprisingly similar since all three materials have rather low carrier mobilities In the last decade a Si H has conquered large market segments in photo voltaics fiat panel displays and detector applications It is surely the most advanced and best understood of the three materials Nano porous TiO<sub>2</sub> is used successfully in a novel solar cell featuring an organic dye absorber This product is now at the brink of commercialization while electronic applica tions for C60 still appear to be in the exploration phase At this stage it appears that some of the insight and many of the exper imental techniques used in the development of a Si H may prove useful in the on going and yet very basic study of TiO<sub>2</sub> and C60 thin films This idea is the guideline to this book Without being comprehensive on the part of amorphous silicon it attempts to outline basic characterization schemes for the nano porous and fullerene materials and to evaluate their potential for applications with respect to a reference which is given by a Si H TEXTBOOK ON OPTICAL FIBER COMMUNICATION AND ITS APPLICATIONS, THIRD EDITION GUPTA, S. Perkampus,2013-03-08 UV VIS spectroscopy is one of the oldest methods in molecular spectroscopy The definitive formulation of the Bouguer Lambert Beer law in 1852 created the basis for the quantitative evaluation of absorption measurements at an early date This led firstly to colorimetry then to photometry and finally to spectrophotometry This evolution ran parallel with the development of detectors for measuring light intensities i e from the human eye via the photo element and photocell to the photomultiplier and from the photo graphic plate to the present silicon diode detector both of which allow simultaneous measurement of the complete spectrum With the development of quantum chemistry increasing attention was paid to the correlation between light absorption and the structure of matter with the result that in recent decades a number of excellent discussions of the theory of electronic spectroscopy UV VIS and luminescence spectroscopy have been published Consequently this extremely interesting aspect of molecular spectroscopy has dominated the teaching of the subject both in my own lectures and those of others However it is often overlooked that in addition to the theory applications of spectroscopic methods are of particular interest to scientists For this reason a lecture series about electronic spectroscopy given in the Institute for Physical Chemistry at the Heinrich Heine University in Dusseldorf was supplemented by one about UV VIS spectroscopy and its applications This formed the basis of the present book
