First Principles Approaches to Spectroscopic Properties of Complex Materials Cristiana Di Valentin, Silvana Botti, Matteo Cococcioni, 2014-09-26 The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology medicine and materials science The goal of each thematic volume is to give the non specialist reader whether in academia or industry a comprehensive insight into an area where new research is emerging which is of interest to a larger scientific audience Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed The coverage is not intended to be an exhaustive summary of the field or include large quantities of data but should rather be conceptual concentrating on the methodological thinking that will allow the non specialist reader to understand the information presented Contributions also offer an outlook on potential future developments in the field Review articles for the individual volumes are invited by the volume editors Readership research chemists at universities or in industry graduate students

Advances in Metal and Semiconductor Clusters M.A. Duncan, 1998-07-27 Cluster Materials is the fourth volume of the highly successful series Advances in Metal and Semiconductor Clusters In this volume the focus is on the properties of clusters which determine their potential applications as new materials Metal and semiconductor clusters have been proposed as precursors for materials or as actual materials since the earliest days of cluster research In the last few years a variety of techniques have made it possible to produce clusters in sizes varying from a few atoms up to several thousand atoms While some measurements are performed in the gas phase on non isolated clusters many cluster materials can now be isolated in macroscopic quantities and more convenient studies of their properties become possible In this volume the authors focus on measurement of optical electronic magnetic chemical and mechanical properties of clusters or of cluster assemblies All of these properties must fall into acceptable ranges of behaviour before useful materials composed of clusters can be put into practical applications As evidenced by the various work described here the realisation of practical products based on cluster materials seems to be approaching rapidly
