Photonics Ralf Menzel, 2013-04-18 Since the invention of the laser in 1960 there has been an enormous increase in the number of applications of this newly available light and its spectacular properties and there is no end to this development in sight In many fields of science technology and medicine laser photons are the driving force of progress In the near future we will probably experience a further rapid development in this field as a result of the widespread industrial production of semiconductor diode lasers and new nonlinear optical materials Light from the new lasers may become even cheaper than that from light bulbs Thus laser

optic devices will influence all sectors of private and public life The high power high brightness narrow bandwidth good coherence special polarization and or short pulses of laser light beams enable new applications Many of these processes will be based on nonlinear optical interactions of the laser light with suitable optical material In these interactions the material is modified by the incident light The light is then in turn modified by the modified matter Finally the nonlinear modification of light as a function of other light becomes possible Light is modified by light To use laser light in this sense in science technology and medicine knowledge from different fields of physics chemistry and engineering is necessary
