Programming Language Landscape Michael Marcotty, Henry F. Ledgard, 1986 Programming Language Landscape Michael Marcotty, Henry F. Ledgard, 1986-02-01 The Programming Language Landscape Henry F. Ledgard, Michael Marcotty, 1981 **The World of Programming Languages** Michael Marcotty, Henry F. Ledgard, 2012-12-06 The earth viewed through the window of an airplane shows a regularity and repetition of features for example hills valleys rivers lakes and forests Nevertheless there is great local variation Vermont does not look like Utah Similarly if we rise above the details of a few programming languages we can discern features that are common to many languages This is the programming language landscape the main features include variables types control structures and input output Again there is local variation Pascal does not look like Basic This work is a broad and comprehensive discussion of the principal features of the major programming languages A Study of Concepts The text surveys the landscape of programming languages and its features Each chapter concentrates on a single language concept A simple model of the feature expressed as a mini language is presented This allows us to study an issue in depth and relative isolation Each chapter concludes with a discussion of the way in which the concept is incorporated into some well known languages This permits a reasonably complete coverage of language issues **Program Verification** Timothy T.R. Colburn, J.H. Fetzer, R.L. Rankin, 2012-12-06 Among the most important problems confronting computer science is that of developing a paradigm appropriate to the discipline Proponents of formal methods such as John McCarthy C.A.R. Hoare and Edgar Dijkstra have advanced the position that computing is a mathematical activity and that computer science should model itself after mathematics Opponents of formal methods by contrast suggest that programming is the activity which is fundamental to computer science and that there are important differences that distinguish it from mathematics which therefore cannot provide a suitable paradigm Disagreement over the place of formal methods in computer science has recently arisen in the form of renewed interest in the nature and capacity of program verification as a method for establishing the reliability of software systems A paper that appeared in Communications of the ACM entitled Program Verification The Very Idea by James H. Fetzer triggered an extended debate that has been discussed in several journals and that has endured for several years engaging the interest of computer scientists both theoretical and applied and of other thinkers from a wide range of backgrounds who want to understand computer science as a domain of inquiry The editors of this collection have brought together many of the most interesting and important studies that contribute to answering questions about the nature and the limits of computer science These include early papers advocating the mathematical paradigm by McCarthy Naur R. Floyd and Hoare in Part I others that elaborate the paradigm by Hoare Meyer Naur and Scherlis and Scott in Part II challenges limits and alternatives explored by C. Floyd Smith Blum and Naur in Part III and recent work focusing on formal verification by DeMillo Lipton and Perlis Fetzer Cohn and Colburn in Part IV It provides essential resources for further study This volume will appeal to scientists

philosophers and laypersons who want to understand the theoretical foundations of computer science and be appropriately positioned to evaluate the scope and limits of the discipline

Computers and Cognition: Why Minds are not Machines J.H. Fetzer, 2013-03-07 An important collection of studies providing a fresh and original perspective on the nature of mind including thoughtful and detailed arguments that explain why the prevailing paradigm the computational conception of language and mentality can no longer be sustained An alternative approach is advanced inspired by the work of Charles S Peirce according to which minds are sign using or semiotic systems which in turn generates distinctions between different kinds of minds and overcomes problems that burden more familiar alternatives Unlike conceptions of minds as machines this novel approach has obvious evolutionary implications where differences in semiotic abilities tend to distinguish the species From this point of view the scope and limits of computer and AI systems can be more adequately appraised and alternative accounts of consciousness and cognition can be more thoroughly criticised Readership Intermediate and advanced students of computer science AI cognitive science and all students of the philosophy of the mind

Artificial Intelligence: Its Scope and Limits J.H. Fetzer, 2012-12-06 This series will include monographs and collections of studies devoted to the investigation and exploration of knowledge information and data processing systems of all kinds no matter whether human other animal or machine Its scope is intended to span the full range of interests from classical problems in the philosophy of mind and philosophical psychology through issues in cognitive psychology and sociobiology concerning the mental capabilities of other species to ideas related to artificial intelligence and to computer science While primary emphasis will be placed upon theoretical conceptual and epistemological aspects of these problems and domains empirical experimental and methodological studies will also appear from time to time The perspective that prevails in artificial intelligence today suggests that the theory of computability defines the boundaries of the nature of thought precisely because all thinking is computational This paradigm draws its inspiration from the symbol system hypothesis of Newell and Simon and finds its culmination in the computational conception of language and mentality The standard conception represented by these views is subjected to a thorough and sustained critique in the pages of this book Employing a distinction between systems for which signs are significant for the users of a system and others for which signs are significant for use by a system I have sought to define the boundaries of what AI in principle may be expected to achieve

Mechanizing Proof Donald MacKenzie,2004-01-30 Most aspects of our private and social lives our safety the integrity of the financial system the functioning of utilities and other services and national security now depend on computing But how can we know that this computing is trustworthy In *Mechanizing Proof* Donald MacKenzie addresses this key issue by investigating the interrelations of computing risk and mathematical proof over the last half century from the perspectives of history and sociology His discussion draws on the technical literature of computer science and artificial intelligence and on extensive interviews with participants MacKenzie argues that our culture now contains two ideals of proof proof as traditionally conducted by human mathematicians and formal mechanized proof He describes the systems constructed by those committed to the latter ideal and the many questions those systems raise about the nature of proof He looks at the primary social influence on the development of automated proof the need to predict the behavior of the computer systems upon which human life and security depend and explores the involvement of powerful organizations such as the National Security Agency He concludes that in mechanizing proof and in pursuing dependable computer systems we do not obviate the need for trust in our collective human judgment
