Oxalate Metabolism in Relation to Urinary Stone G. Alan Rose, 2012-12-06 Oxalate Metabolism in Relation to Urinary Stone is the third monograph to appear in the Bloomsbury Series Edited by Alan Rose the book describes the current clinical and biochemical features of oxalate metabolism Its content and direction fulfil the goals of the Series emphasising the strong links between basic science and clinical medicine London Jack Tinker 30 March 1988 Preface The first oxalate workshop was held in London in 1979 and the proceedings published privately by the Wellcome Foundation At that time the importance of urinary oxalate as a risk factor more important for calcium oxalate stone formation than urinary calcium had been recognized Nevertheless measurements of urinary oxalate still left a lot to be desired and in particular the non enzymatic conversion of ascorbate to oxalate had not been rediscovered so that many measurements must have been wrong Plasma oxalate was still difficult or impossible to measure by any reasonable accessible methods and consequently there was still much argument and speculation about the handling of oxalate by the kidneys A lot of work has been performed in the last eight years on oxalate metabolism and it therefore seemed to the organisers to be a good time to hold a second oxalate workshop

Urolithiasis Margaret S. Pearle, Stephen Y. Nakada, 2009-09-29 Urolithiasis or stone disease occurs in 7% of women and 12% of men at some point and these statistics are rising Furthermore for those who form a stone the likelihood of a recurrence is nearly 50% within 5 years of initial diagnosis Therefore the need for effective minimally invasive alternatives for stone eradication and prevention is critical

disease **The Kidney Today** G. M. Berlyne, 1992-09-30 **The Management of Lithiasis** Jamsheer J. Talati, R.A.L. Sutton, F. Moazam, M. Ahmed, 2012-12-06

The last twenty years has seen the biggest revolution in the treatment of renal tract stone that has ever been experienced in the history of urolithiasis. The treatment of upper tract renal stone has progressed from the days of a very traumatic and morbid procedure to the relatively innocuous walk in walk out therapy of extracorporeal lithotripsy. This progression of events has resulted in a complete reappraisal of management of all types of urinary calculi. From an initial reluctance to treat many stones because of the trauma involved we have now passed to a situation where smaller and asymptomatic stones may be pre-emptively treated before the treatment of serious clinical problems. It is true to say that in Westernized societies the problem of urolithiasis has almost completely been solved by the advent of advanced technology. In this volume attention is drawn to the fact that there are still persistent difficulties in treating urolithiasis in the less developed and less affluent societies. The differences in epidemiology of urolithiasis in various areas of the world are highlighted noting a rapid decrease in the incidence of bladder calculi in impoverished areas where affluence increases. Coupled with this progression of affluence however is the well documented increase in the incidence of upper tract renal stones of oxalate nature. This scenario has been almost universal across all countries in the last few decades.

Calcium Phosphates in Biological and Industrial Systems

Zahid Amjad, 2013-11-27 Calcium Phosphates in Biological and Industrial Systems provides a comprehensive discussion on calcium phosphates in the diverse areas of their applications. The authors are all respected specialists in their particular fields possessing wide knowledge and experience and able to analyze recent results and relate them to their respective areas of expertise. New information as well as a review of current concepts highlights the individual contributions. Animal Models for the Study of Human Disease Saeed R.

Khan, 2013-05-29 Most kidney stones consist of crystals of calcium oxalate (CaOx) and/or calcium phosphate (CaP) and develop on and present on renal papillary surfaces. Stone formation is the last stage in a long process starting with development of supersaturation followed by nucleation, growth, aggregation, and retention of crystals within the kidneys. A number of animal models utilizing mice, pigs, rabbits, and rats, the most common model, have been developed to understand stone pathogenesis. Animals produce crystalline deposits in the kidneys rather than typical stones attached to the papillary surface. Still, there are

many common features between human and rat CaOx nephrolithiasis Both kidney stones in humans and crystal deposits in the rats have an organic matrix comprised of lipids carbohydrate and proteins The crystallization in both human and rat kidneys is modulated by molecules such as osteopontin Tamm Horsfall Proteins inter alpha inhibitor and prothrombin fragment 1 and is associated with enzymuria of proximal tubular origin Hyperoxaluria hypercalciuria hypomagnesuria and hypocitraturia are implicated in both humans and rats CaOx stones renal deposits are common in males of both species while females of both species produce CaP stones renal deposits
