Continental Rifts: Evolution, Structure, Tectonics K.H. Olsen, 1995-11-24 This multi author book has been prepared by an international group of geoscientists that have been active in rift research since the late 1960s In 1984 an informal grass roots study group was initiated to compare individual research results and to explore in greater depth the apparent differences and similarities in the interpretations from various rift systems The group became known as the CREST working group an acronym of Continental Rifts Evolution Structure and Tectonics which not surprisingly became the title of this book Continental Rifts Evolution Structure Tectonics presents an overview of the present state of understanding and knowledge of the processes of continental rifting from a multidisciplinary lithospheric scale perspective The chapters have been structured on each rift system in approximately the same synoptic sequence so as to facilitate comparisons of rifts by the reader The book complements its predecessors by presenting a more unified picture It succeeds in presenting the status of a representative majority of the continental rift systems that have been at the forefront of recent research For students and experienced researchers alike this book will be of significant value in assessing the current state of knowledge and in serving as a framework for future research *Geodynamics of Rifting* P.A. Ziegler, 2015-12-04 This volume contains papers giving an interdisciplinary review of 12 major rift systems from North and South America Africa Europe and Asia These papers are written by an international group of academic and industrial specialists each of whom is most knowledgeable about the respective rift The analyzed rifts were selected on the basis of availability of an as complete as possible geological and geophysical data base Thirteen papers deal with geodynamic processes governing the evolution of rifts A comprehensive digest of the available stratigraphic structural geophysical and petrological data together with an extensive list of references is provided for each of the analyzed rift systems The megatectonic setting and dynamics of evolution of each basin is discussed Geodynamic models are tested against the record of the analyzed rifts The question of active as against passive rifting is addressed The rifts analyzed range in age from Precambrian to Recent and cover a wide spectrum of megatectonic settings There is discussion of the evolution of rifts in a plate tectonic frame The case histories are followed by discussions addressing the global setting of rifts and geodynamic processes active during the development of rifted basins **Geology and Tectonics of the Lake Superior Basin** Richard John Wold, William J. Hinze, 1982-01-01 **Hydrothermal Mineral Deposits** Franco Pirajno, 2012-12-06 This book is intended primarily for exploration geologists and post graduate students

attending specialist courses in mineral exploration Exploration geologists are engaged not only in the search for new mineral deposits but also in the extension and re assessment of existing ones To succeed in these tasks the exploration geologist is required to be a generalist of the Earth sciences rather than a specialist The exploration geologist needs to be familiar with most aspects of the geology of ore deposits and detailed knowledge as well as experience play an all important role in the successful exploration for mineral commodities In order to achieve this it is essential that the exploration geologist be up to date with the latest developments in the evolution of concepts and ideas in the Earth sciences This is no easy task as thousands of publications appear every year in an ever increasing number of journals periodicals and books For this reason it is also difficult at times to locate appropriate references on a particular mineral deposit type although this problem is alleviated by the existence of large bibliographic data bases of geological records abstracts and papers on computers During my teaching to explorationists and indeed during my years of work as an explorationist the necessity of having a text dealing with the fundamental aspects of hydrothermal mineral deposits has always been compelling Metallic mineral deposits can be categorised into three great families namely 1 magmatic 2 sedimentary and residual 3 hydrothermal

Geology of Afar (East Africa) Jacques Varet, 2017-11-14 This book summarizes the geological knowledge accumulated on Afar in the last 60 years demonstrating that it is and will remain a real hot spot for geological and geophysical research It provides insights into the Earth processes along diverging plate boundaries the study of both the continental and oceanic lithosphere and underlying asthenosphere and margins and transitions including magmatic volcanic tectonic sedimentary hydrothermal and geodynamic processes The Afar triangle is a geological depression that developed where the Gulf of Aden Red Sea and East African Rift Valley meet It is considered to be one of the Earth system s most important mantle plumes In 1967 when the first expedition was organized there was little information on the geology of the area and even geographic base maps were lacking However the first satellite photographs from the Apollo and Gemini space missions offered a complete picture of the Red Sea Gulf of Aden region providing a new vision of the Afar triangle The book describes the unique geological features that make Afar the only place in the world where an oceanic plate boundary with all its successive steps of development can be observed in the open air It also presents the Afar triangle as one of the cradles of first now extinct hominids The Middle Awash area contains sites of several fossil discoveries such as the well known Lucy The hydrothermal processes in Afar provide conditions suitable for the study of the most primitive forms of life archaebacterial and it is also one of the few places where significant quantities of telluric energy are available at the surface for geothermal development Further the area has economically interesting mineral deposits and illustrates a number of current climate change issues In addition to providing geological information the book shows that Afar is an area where an individual human population developed with its own language and culture and which adapted to the rugged landscape and extremely dry and hot climate It is a valuable resource for scientists and students and also serves the needs of the Afar nation currently split in three different countries as a result

of recent historical events Geological Survey of Canada, Open File 3228 , *Revisions of Stratigraphic Nomenclature Within the Keweenaw Supergroup of Northern Michigan* William F. Cannon,1992 **Mechanism of Graben Formation** J. H. Illies,2013-10-22 Developments in Geotectonics 17 Mechanism of Graben Formation covers the papers of an ICG Symposium held during the 17th IUGG General Assembly in Canberra Australia on December 5 1979 The book focuses on the formation behavior and mechanisms of grabens The selection first offers information on crustal doming and the mechanism of continental rifting mechanisms of continental riftogenesis and thermal regimes mantle diapirs and crustal stresses of continental rifts The text then ponders on crustal uplift and the propagation of failure zones and parameterized rift development and upper mantle anomalies The publication surveys the continental rift system of the Rhinegraben structure physical properties and dynamical processes and an example of the intrusion of asthenospheric material into the lithosphere as the cause of disruption of lithospheric plates Regional stress field and rifting in Western Europe and the nature of greenstone belts in the Precambrian are also discussed The selection is a dependable source of information for geologists and readers interested in the formation of grabens **U.S. Geological Survey Bulletin** ,1983 **Stress Field Control of Eruption Dynamics** Roberto Sulpizio,Antonio Costa,Geoffrey Wadge,2017-10-10 Increasing evidence supports the claim that stress changes play a fundamental role in triggering volcanic eruptions Stress changes may vary in origin to include earthquakes erosion and landslide processes deglaciation or tidal effects The local stress can also change as response of magma influx from deeper reservoirs and an increase of the magma gas pressure The stress transfer may be of great importance in reawakening a dormant system As an example significant statistical correlation of large earthquakes and eruptions in time and space was suggested in many works The interaction may be two fold where magma intrusions may change the stress at active faults and trigger earthquakes while tectonic earthquakes may affect the magmatic system and change the eruption activity The change in local tectonic stress has been claimed as trigger of large ignimbrite eruptions or for controlling the eruptive style of explosive eruptions Sometimes volcano systems that are nested or closely located may become active in chorus neighbouring volcanoes may interact in the sense that one volcano triggers its neighbouring volcano However although there is ample evidence of concurrence the processes of interacting volcanoes and near to far field tectonic stress are not well understood Some studies suggest that volcanic eruptions are triggered if compressive stress acts at the magma system and squeezes out magma Other studies suggest that extensional stress fields facilitate magma rise and thus encourage eruptions or that fluctuating compression and extension during the passing of seismic waves trigger eruptions This research topic tries to address some of the important open questions in interaction between stress field and volcanic eruption though both review papers and new contributions **Initial Reports of the Deep Sea Drilling Project** Scripps Institution of Oceanography,1978 **Alkaline Rocks and Carbonatites of the World** Alan Robert Woolley,1987 This text describes and provides ready access to the literature for all known occurrences of alkaline igneous rocks and
