The Photographic Atlas of the Moon is a day by day photographic guide to observing the features of the Moon through a small telescope. Compiled by three keen amateur astronomers, each image was produced using a 40cm telescope and high resolution low speed film. Whole Moon images are provided for each day of the 29 day lunar cycle with labelled features and accompanying descriptive text. Selected lunar features are shown at high magnification to highlight and clearly illustrate certain regions. All lunar features are labelled using current IAU terminology. A comprehensive set of appendices detail the phases of the Moon, give a chronology of lunar selenography and index all lunar features named in the text. This atlas is an invaluable reference guide for amateurs engaging in lunar observations with a small telescope.

Written by a dedicated selenophile, a person who loves the Moon, this guide to Earth's celestial companion is a non-technical narrative that quickly elevates the lunar novice to lunar authority. Photographic Atlas of the Moon explains how the Earth and the Moon are locked together in a co-dependent embrace, each affecting the other in ways that impact our lives. The reader will learn in comprehensible jargon-free language about the Moon: we see its orbit, its creation, and the differing geologic details of the Moon, some of which can be seen with the naked eye. All the photographs in this lavishly illustrated book were taken by the author, an internationally recognized authority on celestial photography. Reeves has perfected image processing techniques that allow the amateur astronomer using modest equipment to exceed the quality of Earth-based professional lunar photographs taken during the Apollo era. Although Reeves is an accomplished deep sky photographer, his current passion is re-popularizing the Moon within the amateur astronomy community. Momentum is building for a manned return to the Moon to continue the exploration started over half a century ago. Photographic Atlas of the Moon will provide even the most novice reader with an understanding of the Moon and its allure so they can appreciate the upcoming explorations by NASA's Artemis lunar program.

 The aim of the present book has been to provide an outline the first of its kind of the history of the human efforts to map the  
 topography of the surface of our satellite from the days of pre telescopic astronomy up to the present These efforts  
 commenced modestly at the time when the unaided eye was still the only tool at the disposal of men interested in the face of  
 our satellite and were continued since for more than three centuries by a small band of devoted friends of the Moon in  
 several countries Many of these were amateur astronomers and almost all were amateur cartographers though some highly  
 skilled in their art The reader interested in the history of lunar mapping between 1600 and 1960 will find its outline in the  
 first chapter of this book and can follow the way in which the leadership in the mapping of the Moon the cradle of which  
 stood in Italy passed successively to France Germany and eventually to the United States All efforts described in this chapter  
 were wholly superseded by subsequent developments since 1960 largely motivated by logistic needs of a grand effort which  
 culminated with repeated manned landings on the Moon between 1969 1972 a feat which will remain for ever one of the  
 glories of our century
