

WHALES

PHOTOGRAPHIC IDENTIFICATION

Below we look at the characteristics researchers use to identify the cetaceans we encounter.

We have a photographer on board all Bremer Canyon expeditions.

1 KILLER WHALE (ORCA)

Killer whales (orca) are identified by variations in nicks and notches in the dorsal fin, variations in dorsal fin shape and size and variations in the shape of the white eye patch and the grey marking behind the dorsal fin called the saddle patch.

2 HUMPBACK WHALES

Humpback whales are identified by variations in colour patterns of the ventral side of the fluke (tail) and/or of dorsal fin and flank.

3 SOUTHERN RIGHT WHALES

Southern Right Whales are identified by the patches of calluses on the head. These are classified, roughened patches of skin. About 5% of the right whale population in Western Australia has an unusual, mottled pale skin coloration. Blue whales have distinctive dorsal fin shapes, fluke markings and notching on their flanks that allow individuals to be identified.

4 SPERM WHALES

Sperm whales can be identified by the variations in nicks and notches on the trailing edge of their flukes (tail). Adult males are much larger than females, and can also be distinguished by the presence or absence of calluses on the dorsal hump. A large percentage of females (about 85%) have calluses, whereas males almost never have them.

5 FALSE KILLER WHALES AND OTHER DOLPHINS

Over time, information from photographic identification studies provides a wealth of information about whales and dolphins including:

- population size
- survival rates
- reproduction
