---

### About the Company

- Digital real estate investment company
- Manages a portfolio of over 4 million domain names
- Specializes in domain monetization and development
- Features a domain name marketplace with presence in more than 100 countries

---

### Goals

- Automate domain valuation process for acquisition purposes
- Decrease expenditure in manual pricing of domain names
- Identify low-value domains to drop them and reduce renewal costs

---

### Approach

- Develop a statistical model relating domain characteristics with selling price
- The statistical model would also classify the domains into various categories to streamline the company's workflow
- Deploy the model to use it as a real-time decision tool

### Digital Real Estate Portfolio Manager Utilizes Statistical Model to Streamline their Domain Name Trading Procedures.

The company specializes in Digital Real Estate Management. Their main business line consists of purchasing domain names, attempting to increase their value (by monetizing them, driving traffic to them, etc.) and then sell them at a higher price.

The most important challenge facing this company lies in the domain valuation procedure. For most domain names, the price was assessed by conducting a "manual" review, which consists of a review done by the company's staff and a pricing recommendation based on it.

Given the large amount of domain names that become available for purchasing every day, this procedure is extremely costly, time-consuming, and error-prone. Precision Consulting was approached to:

- Review and analyze a database of billions of domain names and their characteristics, such as existing traffic, keyword value, Alexa ranking, number of inbound links, etc.
- Based on this dataset, develop a model that would help:
  - produce an estimate of the value of the domain
  - categorize the domain into "valueless", "automatic pricing" or "premium"

### Solution

Precision Consulting worked with the company to understand its goals and analysis objectives. Precision's expertise in Statistical Modeling allowed creating a model that would produce a forecast of the domain name price based solely on the available information about the domain, without any human intervention required.

The modeling was conducted in two steps. First, a binary logistic regression model was used to estimate the probability that the company would be able to sell a given domain in the future. Following that, General Linear Model analysis was used to estimate the dollar value of a domain assuming that the sale occurred.
