The Global Positioning System GPS is a satellite based navigation system that was originally designed for the U S military
However the number of civilian GPS users now exceeds the military users and many commercial markets have emerged This
book identifies technical improvements that would enhance military civilian and commercial use of the GPS Several technical
improvements are recommended that could be made to enhance the overall system performance **NAVSTAR Global**

System , 1981 The Navstar Global Positioning System GPS although primarily designed for three dimensional position and
velocity determination is uniquely capable of providing highly accurate and stable timing information to users This capability
is derived from the time delay pseudo ranging concept which forms the basis for GPS navigation The combination of
navigation and timing together in one system will make GPS the Precise Time and Time Interval PTTI source of choice for the
foreseeable future Only GPS can supply continuous timing data world wide in any weather to a dynamically moving user at a
previously unsurveyed site with submicrosecond accuracy traceable to an established reference This paper discusses the
application of Navstar GPS to the problems of PTTI dissemination A short review of the GPS concept leads to a detailed

description of the implementation of time transfer through Navstar GPS Time is followed from the U S Naval Observatory USNO through the ground control satellite and receiving segments of GPS to the user s clock system The three options by which a user s system can receive from the GPS receivers currently under development by the DOD are defined in detail The electrical digital mechanical interface parameters along with suggested methods for their use are outlined for each option A detailed error model is also presented for the traceability of UTG GPS to UTC USNO Although absolute accuracy of UTC GPS provided to a user is specified to be slightly over 100 nanoseconds rms substantially better accuracies can be easily achieved By understanding and working around some of the GPS error uncertainties real time synchronization between stationary users on the same continent can be controlled to within a few nanoseconds and absolute post processed time offset with UTC USNO measured within 25 nanoseconds or better
