## Science After 40 Osiris Volume 7:

**Stalinist Science** Nikolai Krementsov, 1996-11-25 Some scholars have viewed the Soviet state and science as two monolithic entities with bureaucrats as oppressors and scientists as defenders of intellectual autonomy Based on previously unknown documents from the archives of state and Communist Party agencies and of numerous scientific institutions Stalinist Science shows that this picture is oversimplified Even the reinstated Science Department within the Central Committee was staffed by a leading geneticist and others sympathetic to conventional science In fact a symbiosis of state bureaucrats and scientists established a much more terrifying system of control over the scientific community than any critic of Soviet totalitarianism had feared Some scientists on the other hand developed more elaborate devices to avoid and exploit this control system than any advocate of academic freedom could have reasonably hoped Nikolai Krementsov argues that the model of Stalinist science already taking hold during the thirties was reversed by the need for inter Allied cooperation during World War II Science as a tool for winning the war and as a diplomatic and propaganda instrument began to enjoy higher status better funding and relative autonomy Even the reinstated Science Department within the Central Committee was staffed by a leading geneticist and others sympathetic to conventional science However the onset of the Cold War led to a campaign for eliminating such servility to the West Then the Western links that had benefited genetics and other sciences during the war and through 1946 became a liability and were used by Lysenko and others to turn back to the repressive past and to delegitimize whole research directions

**Scientific Research In World War II** Ad Maas, Hans Hooijmaijers, 2009-01-13 Scientific Research in World War II seeks to explore how scientists managed to cope with the particular circumstances created by the war The book focuses on both war waging countries such as the United Kingdom Japan Germany and the United States and those under occupation such as the Netherlands and France

Opening Standards Laura Denardis, 2011-09-02 The economic and political stakes in the current heated debates over openness and open standards in the Internet's architecture Openness is not a given on the Internet Technical standards the underlying architecture that enables interoperability among hardware and software from different manufacturers increasingly control individual freedom and the pace of innovation in technology markets Heated battles rage over the very definition of openness and what constitutes an open standard in information and communication technologies In Opening Standards experts from industry academia and public policy explore just what is at stake in these controversies considering both economic and political implications of open standards The book examines the effect of open standards on innovation on the relationship between interoperability and public policy and if government has a responsibility to promote open standards and on intellectual property rights in standardization an issue at the heart of current global controversies Finally Opening Standards

recommends a framework for defining openness in twenty first century information infrastructures Contributors discuss such topics as how to reflect the public interest in the private standards setting process why open standards have a beneficial effect on competition and Internet freedom the effects of intellectual property rights on standards openness and how to define standard open standard and software interoperability *Historia Scientiarum*, 1998 *Secret Weapons and World War II* Walter E. Grunden, 2005 Grunden's analysis of this fundamental flaw in the Japanese war effort seamlessly weaves together science technology and military history to provide an entirely unique look at a crucial but understudied aspect of World War II Comparing the science and weapons programs of all the major combatants he demonstrates that Japan's failure was nearly inevitable given its paucity of strategic resources an inadequate industrial base the absence of effective centralized management to coordinate research military hostility toward civilian scientists and bitter interservice rivalries In the end Japan could not overcome these obstacles and thus failed to make the transition to the kind of Big Science it needed to ward off its enemies and dominate the Far East BOOK JACKET *Science and Technology in the Global Cold War* Naomi Oreskes, John Krige, 2014-11-07 Investigations of how the global Cold War shaped national scientific and technological practices in fields from biomedicine to rocket science The Cold War period saw a dramatic expansion of state funded science and technology research Government and military patronage shaped Cold War technoscientific practices imposing methods that were project oriented team based and subject to national security restrictions These changes affected not just the arms race and the space race but also research in agriculture biomedicine computer science ecology meteorology and other fields This volume examines science and technology in the context of the Cold War considering whether the new institutions and institutional arrangements that emerged globally constrained technoscientific inquiry or offered greater opportunities for it The contributors find that whatever the particular science and whatever the political system in which that science was operating the knowledge that was produced bore some relation to the goals of the nation state These goals varied from nation to nation weapons research was emphasized in the United States and the Soviet Union for example but in France and China scientific independence and self reliance dominated The contributors also consider to what extent the changes to science and technology practices in this era were produced by the specific politics anxieties and aspirations of the Cold War Contributors Elena Aronova Erik M Conway Angela N H Creager David Kaiser John Krige Naomi Oreskes George Reisch Sigrid Schmalzer Sonja D Schmid Matthew Shindell Asif A Siddiqi Zuoyue Wang Benjamin Wilson **Science and Modern India: An Institutional History, c.1784-1947: Project of History of Science, Philosophy and Culture in Indian Civilization, Volume XV, Part 4** Das Gupta, 1900 Science and Modern India An Institutional History c 1784 1947 Project of History of Science Philosophy and Culture in Indian Civilization Volume XV Part 4 comprises chapters contributed by eminent scholars It discusses the historical background of the establishment of science institutes that were established in pre Independence India and still exist their functions and their present status This volume discusses Indian science institutes that

B. Kozhevnikov,2011 This volume reprints Paul Forman s classic papers on the history of physics in post World War I Germany and the invention of quantum mechanics The Forman thesis has become famous as the first argument in favor of the cultural conditioning of scientific knowledge in particular for its demonstration of the historical connection between the culture of Weimar Germany known for its irrationality and antiscientism and the emerging concept of quantum acausality At the 2007 international conference in Vancouver Canada leading historians of physics discussed the implications of the Forman thesis in the historiography of modern science Their papers collected in this volume represent a cutting edge research on the history of quantum revolution      **Supersizing Science** Niki Vermeulen,2010 In recent years there has been a clear rise in scientific collaboration as well as in studies on the subject While most scholars examine disciplines traditionally known to be collaborative such as physics and space research this book focuses on biology It investigates the growing collaboration in the life sciences or the emergence of what is called big biology While the Human Genome Project is often presented as the first large scale research project in biology cooperation in the life sciences has a longer history A comparison between centralised big physics and big biology reveals how the latter has a networked structure which evolved in interaction with the integration of information and communication technologies By concentrating on the construction of these networks three contemporary large scale research collaborations are analysed the Census of Marine Life that aims to make an inventory of life in the oceans the Silicon Cell initiative that wants to design a replica of a cell in a computer and the VIRGO consortium which investigates host virus interaction to develop a new therapy against influenza This book demonstrates how the process of making science bigger or the supersizing of science transforms the ways in which science is organised while it also changes the work of scientists involved As such this has both scholarly and professional implications for the next generation of scientists      *Clio Wired* Roy Rosenzweig,2011 In these essays Rosenzweig pioneering historian and self proclaimed technorealist weighs the effect of new media digital technology and the Internet on recording researching and teaching history      **Science and Technology in World History, Volume 3** David Deming,2014-01-10 This installment in a series on science and technology in world history begins in the fourteenth century explaining the origin and nature of scientific methodology and the relation of science to religion philosophy military history economics and technology Specific topics covered include the Black Death the Little Ice Age the invention of the printing press Martin Luther and the Reformation the birth of modern medicine the Copernican Revolution Galileo Kepler Isaac Newton and the Scientific Revolution      Reflections on Europe in Space John Krige,Arturo

How does scientific knowledge circulate Does scientific communication shape the making of science Is the making of science a national endeavour or does it have an international or transnational dimension Are teaching and research equally relevant in this endeavour How can history of science react to the challenges posed by the changing practices of science in historical context Beyond Borders is a book generated at the heart of these fundamental questions In the last decades the history of science has attained a high degree of disciplinary maturity and sophistication However perception of disciplinary crisis is apparent behind calls for the search of new big pictures and their implementation in teaching and communicating the history of science to wider audiences Temporal and narrative fragmentation are seen as major drawbacks hindering the development of the discipline In addition national linguistic and methodological division is increasingly afflicting its practice Like other areas in the humanities and in contrast to the sciences the history of science has nowadays a pronounced local character which clearly constrains its intellectual output Challenging this state of affairs is a major aim of this book which argues for a resolute call for intellectual and methodological pluralism and internationalism Through a broad diversity of subjects periods and geographies covering from studies of sixteenth century astrological texts to contextual analysis of twentieth century X ray spectroscopy this collection of papers and historiographical essays offers a fresh overview of the field and its major questions Beyond Borders revisits five major topics in history of science namely the early modern map of knowledge pedagogy and science science popularization science and the nation and the geography of scientific centres and peripheries Engaging with a broad diversity of historiographical and methodological approaches in an international perspective Beyond Borders is a rich and plural manifesto contributing to the reflective appraisal of history of science as a discipline
