Stewart,Terry Howell,2003-07-31 PRINT ONLINE PRICING OPTIONS AVAILABLE UPON REQUEST AT e reference taylorandfrancis com **Is Water H₂O?** Hasok Chang,2012-05-23 This book exhibits deep philosophical quandaries and intricacies of the historical development of science lying behind a simple and fundamental item of common sense in modern science namely the composition of water as H₂O Three main phases of development are critically re examined covering the historical period from the 1760s to the 1860s the Chemical Revolution through which water first became recognized as a compound not an element early electrochemistry by which water s compound nature was confirmed and early atomic chemistry in which water started out as HO and became H₂O In each case the author concludes that the empirical evidence available at the time was not decisive in settling the central debates and therefore the consensus that was reached was unjustified or at least premature This leads to a significant re examination of the realism question in the philosophy of science and a unique new advocacy for pluralism in science Each chapter contains three layers allowing readers to follow various parts of the book at their chosen level of depth and detail The second major study in complementary science this book offers a rare combination of philosophy history and science in a bid to improve scientific knowledge through history and philosophy of science *An Introduction to Water Quality Science* Sourav Das,2023-09-25 This book discusses the significance of water quality parameters in aquatic ecosystems offering a concise and practical measurement methodology for early career researchers and post graduate students in the fields of environmental science oceanography and aquatic science The keys topics covered include aquatic sampling basics of physicochemical properties and carbonate chemistry of aquatic science the importance of nutrients in natural water bodies biological productivity in aquatic ecosystems aquatic pollution and statistical analyses of different types of water science data Several parameters such as microplastics dimethylsulfoniopropionate and polychlorinated biphenyls have also been incorporated in the book for comprehensive coverage of the topic The book is meant as a practical guide for beginners and young researchers using a clear writing style and practical examples highlighting the significance of water science parameters and their measurement protocols in aquatic environments The Basis of Civilization--water Science? science to enhance water quality monitoring in developing countries Pattinson, N. B., Taylor, J., Dickens, Chris W. S., Graham, P. M., 2023-12-31 Freshwater systems are disproportionately adversely affected by the ongoing global environmental crisis The effective and efficient water resource conservation and management necessary to mitigate the crisis requires monitoring data especially on water quality This is recognized by Sustainable Development Goal SDG 6 particularly indicator 6.3.2 which requires all UN member states to measure and report the proportion of water bodies with good ambient water quality However gathering sufficient data on water quality is reliant on data collection at spatial and temporal scales that are generally outside the capacity of institutions using conventional methods Digital technologies such as wireless sensor networks and remote sensing have come to the fore as promising avenues to increase the scope of data collection and reporting Citizen science which goes by many names e.g. participatory science or community based monitoring has also been earmarked as a powerful mechanism to improve monitoring However both avenues have drawbacks and limitations The synergy between the strengths of modern technologies and citizen science presents an opportunity to use the best features of each to mitigate the shortcomings of the other This paper briefly synthesizes recent research illustrating how smartphones sometimes in conjunction with other sensors present a nexus point method for citizen scientists to engage with and use sophisticated modern technology for water quality monitoring This paper also presents a brief non exhaustive research synthesis of some examples of current technological upgrades or innovations regarding smartphones in citizen science water quality monitoring in developing countries and how these can assist in objective comprehensive and improved data collection management and reporting While digital innovations are being rapidly developed worldwide there remains a paucity of scientific and socioeconomic validation of their suitability and usefulness within citizen science This perhaps contributes to the fact that the uptake and upscaling of smartphone assisted citizen science continues to underperform compared to its potential within water resource management and SDG reporting Ultimately we recommend that more rigorous scientific research efforts be dedicated to exploring the suitability of digital innovations in citizen science in the context of developing countries and SDG reporting

Water System Science and Policy Interfacing Philippe Quevauviller, 2010 Recent discussions among scientists and policy makers have highlighted that knowledge generated by many research and demonstration projects is not reaching policymakers in an efficient way Conversely the consideration of research results by the policy making community is not straightforward and difficulties arise in integrating the latest research developments in legislation The difficulty is enhanced by the fact that the policy making community is not defining its role as client sufficiently well and the dialogue and communication channels are far from ideal to ensure an efficient flow of information An increasing number of experts consider that improvements could be achieved through the development of a science policy interface so that R D results are synthesised in a way to efficiently feed policy implementation and that short medium and long term research needs may be identified This book examines the issue of integrating science into policy with an emphasis on water

system knowledge and related policies An important feature of the book is the discussion of science policy interfacing needs illustrated by examples from authors from different countries in relation to water system management This publication is timely in that the science policy interfacing is now identified as a key challenge worldwide with regard to integrated water resource management and therefore the book will be of great interest to scientists water managers and stakeholders Readers will also benefit from a better understanding of the needs benefits and drawbacks of an established transfer mechanism of scientific outputs to policies
