Bender, 2022-05-31 Many NLP tasks have at their core a subtask of extracting the dependencies who did what to whom from natural language sentences This task can be understood as the inverse of the problem solved in different ways by diverse human languages namely how to indicate the relationship between different parts of a sentence Understanding how languages solve the problem can be extremely useful in both feature design and error analysis in the application of machine learning to NLP Likewise understanding cross linguistic variation can be important for the design of MT systems and other multilingual applications The purpose of this book is to present in a succinct and accessible fashion information about the morphological and syntactic structure of human languages that can be useful in creating more linguistically sophisticated more language independent and thus more successful NLP systems Table of Contents Acknowledgments Introduction motivation Morphology Introduction Morphophonology Morphosyntax Syntax Introduction Parts of speech Heads arguments and adjuncts Argument types and grammatical functions Mismatches between syntactic position and semantic roles Resources Bibliography Author's Biography General Index Index of Languages

Natural Language Processing and Information Systems

Birger Andersson, Maria Bergholtz, P. Johannesson, 2003-07-01 The workshop on Applications of Natural Language to Information Systems NLDB has since 1995 provided a forum for academic and industrial researchers and practitioners to discuss the application of natural language to both the development and use of software applications

The use of natural language in relation to software has contributed to improving the development of software from the viewpoints of both the developers and the users. Developers benefit from improvements in conceptual modeling software validation natural language program specifications and many other areas. Users benefit from increased usability of applications through natural language query interfaces semantic webs text summarizations etc. The integration of natural language and information systems has been a search objective for a long time now. Today the goal of good integration seems not so far fetched. This is due mainly to the rapid progress of research in natural language and to the development of new and powerful technologies. The integration of natural language and information systems has become a convergent point towards which many researchers from several research areas are focussing.

Mohamed Zakaria Kurdi, 2017-11-29 Natural Language Processing NLP is a scientific discipline which is found at the intersection of fields such as Artificial Intelligence Linguistics and Cognitive Psychology. This book presents in four chapters the state of the art and fundamental concepts of key NLP areas. Are presented in the first chapter the fundamental concepts in lexical semantics lexical databases knowledge representation paradigms and ontologies. The second chapter is about combinatorial and formal semantics. Discourse and text representation as well as automatic discourse segmentation and interpretation and anaphora resolution are the subject of the third chapter. Finally in the fourth chapter I will cover some aspects of large scale applications of NLP such as software architecture and their relations to cognitive models of NLP as well as the evaluation paradigms of NLP software. Furthermore I will present in this chapter the main NLP applications such as Machine Translation MT Information Retrieval IR as well as Big Data and Information Extraction such as event extraction sentiment analysis and opinion mining.

Natural Language Processing in Prolog Gerald Gazdar, Christopher S.

Mellish, 1989 Explains how computers can be programmed to recognize the complex ambiguities of human language. Addresses current techniques in syntax semantics and pragmatics program listings showing applications in Prolog and question answering and inference. Targeted at professionals in the artificial intelligence community.

An Introduction to Language Processing with Perl and Prolog

Pierre M. Nugues, 2006-11-22 The areas of natural language processing and computational linguistics have continued to grow in recent years driven by the demand to automatically process text and spoken data. With the processing power and techniques now available research is scaling up from lab prototypes to real world proven applications. This book teaches the principles of natural language processing first covering linguistics issues such as encoding entropy and annotation schemes defining words tokens and parts of speech and morphology. It then details the language processing functions involved including part of speech tagging using rules and stochastic techniques using Prolog.

to write phase structure grammars parsing techniques and syntactic formalisms semantics predicate logic and lexical semantics and analysis of discourse and applications in dialog systems The key feature of the book is the author's hands on approach throughout with extensive exercises sample code in Prolog and Perl and a detailed introduction to Prolog The reader is supported with a companion website that contains teaching slides programs and additional material The book is suitable for researchers and students of natural language processing and computational linguistics

Introducing Speech and Language Processing John S. Coleman, 2005-03-03 This major new textbook provides a clearly written concise and accessible introduction to speech and language processing Assuming knowledge of only the very basics of linguistics and written specifically for students with no technical background it is the perfect starting point for anyone beginning to study the discipline Student's are shown from an elementary level how to use two programming languages C and Prolog and the accompanying CD ROM contains all the software needed Setting an invaluable foundation for further study this is set to become the leading introduction to the field

Introduction to Natural Language Processing Jacob Eisenstein, 2019-10-01 A survey of computational methods for understanding generating and manipulating human language which offers a synthesis of classical representations and algorithms with contemporary machine learning techniques This textbook provides a technical perspective on natural language processing methods for building computer software that understands generates and manipulates human language It emphasizes contemporary data driven approaches focusing on techniques from supervised and unsupervised machine learning The first section establishes a foundation in machine learning by building a set of tools that will be used throughout the book and applying them to word based textual analysis The second section introduces structured representations of language including sequences trees and graphs The third section explores different approaches to the representation and analysis of linguistic meaning ranging from formal logic to neural word embeddings The final section offers chapter length treatments of three transformative applications of natural language processing information extraction machine translation and text generation End of chapter exercises include both paper and pencil analysis and software implementation The text synthesizes and distills a broad and diverse research literature linking contemporary machine learning techniques with the field's linguistic and computational foundations It is suitable for use in advanced undergraduate and graduate level courses and as a reference for software engineers and data scientists Readers should have a background in computer programming and college level mathematics After mastering the material presented students will have the technical skill to build and analyze novel natural language processing systems and to understand the latest research in the field

Exploring Time, Tense, and Aspect in Natural Language Database Interfaces Ion Androutsopoulos, 2002-01-01 Advances in temporal databases make it increasingly easier to store time dependent information creating a need for facilities that will help end users access this information In the context of natural language interaction significant effort has been devoted to interfaces that allow database queries to be formulated in natural language Most of the

existing interfaces however do not support adequately the notion of time Drawing upon tense and aspect theories temporal logics and temporal databases this cross discipline book examines relevant issues from the three areas developing a unified theoretical framework that can be used to build natural language interfaces to temporal databases The framework features an HPSG mapping from English to a formally defined meaning representation language and a corresponding mapping to a temporal extension of the SQL database language The book is accompanied by a freely available prototype interface built according to the framework and implemented using Prolog and ALE This is the first in depth exploration of the notion of time in natural language database interfaces It will be particularly interesting to researchers working on natural language interaction tense and aspect HPSG temporal logics and temporal databases especially those who wish to learn about time related issues in other disciplines

Natural Language Computing Ray C. Dougherty, 2013-03-07 This book's main goal is to show readers how to use the linguistic theory of Noam Chomsky called Universal Grammar to represent English French and German on a computer using the Prolog computer language In so doing it presents a follow the dots approach to natural language processing linguistic theory artificial intelligence and expert systems The basic idea is to introduce meaningful answers to significant problems involved in representing human language data on a computer
