On Optimal Interconnections for VLSI Andrew B. Kahng, Gabriel Robins, 1994-12-31 *On Optimal Interconnections for VLSI* describes from a geometric perspective algorithms for high performance, high density interconnections during the global and detailed routing phases of circuit layout. First, the book addresses area minimization with a focus on near-optimal approximation algorithms for minimum cost Steiner routing. In addition to practical implementations of recent methods, the implications of recent results on spanning tree degree bounds and the method of Zelikovsky are discussed. Second, the book addresses delay minimization, starting with a discussion of accurate yet algorithmically tractable delay models. Recent minimum delay constructions are highlighted, including provably good cost-radius tradeoffs, critical sink routing algorithms, Elmore delay, optimal routing, graph Steiner arborescences, non-tree routing, and wiresizing. Third, the book addresses skew minimization for clock routing and prescribed delay routing formulations. The discussion starts with early matching-based constructions and goes on to treat zero skew routing with provably minimum wirelength, as well as planar clock routing. Finally, the book concludes with a discussion of multiple

competing objectives i.e. how to optimize area delay skew and other objectives simultaneously These techniques are useful when the routing instance has heterogeneous resources or is highly congested as in FPGA routing multi chip packaging and very dense layouts Throughout the book the emphasis is on practical algorithms and a complete self contained development On Optimal Interconnections for VLSI will be of use to both circuit designers CAD tool users as well as researchers and developers in the area of performance driven physical design
