Schrodinger Operators Markov Semigroups Wavelet Analysis Operator Algebras Advances In Partial Differential Equations:

Schrödinger Operators, Markov Semigroups, Wavelet Analysis, Operator Algebras Michael Demuth, 1996 The analysis of partial differential equations has stimulated large areas of research in mathematical physics harmonic analysis and operator theory The present volume illuminates the depth and variety of these interactions It begins with a survey on the use of semiclassical analysis and maximum principle techniques in statistical mechanics There follows an article presenting the perturbation theory for generators of Markov semigroups acting on L_p The third contribution provides a self contained introduction to continuous wavelet analysis including its relations to function spaces and microlocal regularity this is particularly topical as wavelet methods have been applied with great success in the past decade to problems in harmonic and numerical analysis as well as in diverse fields of engineering The final section explores pseudo differential analysis on singular configurations with special emphasis on C^* algebra techniques Mellin operators and analytical index formulas

Nonlinear Hyperbolic Equations, Spectral Theory, and Wavelet Transformations Sergio Albeverio, Michael Demuth, Elmar Schrohe, Bert-Wolfgang Schulze, 2012-12-06 This volume focuses on recent developments in non linear and hyperbolic equations It will be a most valuable resource for researchers in applied mathematics the theory of wavelets and in mathematical and theoretical physics Nine up to date contributions have been written on invitation by experts in the respective fields The book is the third volume of the subseries Advances in Partial Differential Equations

Microlocal Analysis and Spectral Theory Luigi Rodino, 2012-12-06 The NATO Advanced Study Institute Microlocal Analysis and Spectral Theory was held in Tuscany Italy at Castelveccchio Pascoli in the district of Lucca hosted by the international vacation center 11 Ciocco from September 23 to October 3 1996 The Institute recorded the considerable progress realized recently in the field of Microlocal Analysis In a broad sense Microlocal Analysis is the modern version of the classical Fourier technique in solving partial differential equations where now the localization proceeding

takes place with respect to the dual variables too Precisely through the tools of pseudo differential operators wave front sets and Fourier integral operators the general theory of the linear partial differential equations is now reaching a mature form in the frame of Schwartz distributions or other generalized functions At the same time Microlocal Analysis has grown up into a definite and independent part of Mathematical Analysis with other applications all around Mathematics and Physics one major theme being Spectral Theory for Schrodinger equation in Quantum Mechanics

Hypoelliptic Estimates and Spectral Theory for Fokker-Planck Operators and Witten Laplacians Francis Nier, Bernard Helffer, 2005-01-17 There has recently been a renewal of interest in Fokker Planck operators motivated by problems in statistical physics in kinetic equations and differential geometry Compared to more standard problems in the spectral theory of partial differential operators those operators are not self adjoint and only hypoelliptic The aim of the analysis is to give as generally as possible an accurate qualitative and quantitative description of the exponential return to the thermodynamical equilibrium While exploring and improving recent results in this direction this volume proposes a review of known techniques on the hypoellipticity of polynomial of vector fields and its global counterpart the global Weyl H rmander pseudo differential calculus the spectral theory of non self adjoint operators the semi classical analysis of Schr dinger type operators the Witten complexes and the Morse inequalities

Elliptic Mixed, Transmission and Singular Crack Problems Gohar Harutyunyan, Bert-Wolfgang Schulze, 2007 Mixed transmission or crack problems belong to the analysis of boundary value problems on manifolds with singularities The Zaremba problem with a jump between Dirichlet and Neumann conditions along an interface on the boundary is a classical example The central theme of this book is to study mixed problems in standard Sobolev spaces as well as in weighted edge spaces where the interfaces are interpreted as edges Parametrices and regularity of solutions are obtained within a systematic calculus of boundary value problems on manifolds with conical or edge singularities This calculus allows singularities on the interface and homotopies between mixed and crack problems Additional edge conditions are computed in terms of relative index results In a detailed final chapter the intuitive ideas of the approach are illustrated and there is a discussion of future challenges A special feature of the text is the inclusion of many worked out examples which help the reader to appreciate the scope of the theory and to treat new cases of practical interest This book is addressed to mathematicians and physicists interested in models with singularities associated boundary value problems and their solvability strategies based on pseudo differential operators The material is also useful for students in higher semesters and young researchers as well as for experienced specialists working in analysis on manifolds with geometric singularities the applications of index theory and spectral theory operator algebras with symbolic structures quantisation and asymptotic analysis

Crack Theory and Edge Singularities D. V. Kapanadze, Bert-Wolfgang Schulze, 2013-03-14 Boundary value problems for partial differential equations play a crucial role in many areas of physics and the applied sciences Interesting phenomena are often connected with geometric singularities for instance in mechanics

Elliptic operators in corresponding models are then singular or degenerate in a typical way. The necessary structures for constructing solutions belong to a particularly beautiful and ambitious part of the analysis. Cracks in a medium are described by hypersurfaces with a boundary. Configurations of that kind belong to the category of spaces manifolds with geometric singularities here with edges. In recent years the analysis on such in general stratified spaces has become a mathematical structure theory with many deep relations with geometry topology and mathematical physics. Key words in this connection are operator algebras index theory quantisation and asymptotic analysis. Motivated by Lamé's system with two sided boundary conditions on a crack we ask the structure of solutions in weighted edge Sobolev spaces and subspaces with discrete and continuous asymptotics. Answers are given for elliptic systems in general. We construct parametrices of corresponding edge boundary value problems and obtain elliptic regularity in the respective scales of weighted spaces. The original elliptic operators as well as their parametrices belong to a block matrix algebra of pseudo differential edge problems with boundary and edge conditions satisfying analogues of the Shapiro Lopatinskij condition from standard boundary value problems. Operators are controlled by a hierarchy of principal symbols with interior boundary and edge components.

Approaches to Singular Analysis Juan B. Gil, Daniel Grieser, Matthias Lesch, 2012-12-06. The purpose of this publication is to present in one book various approaches to analytic problems that arise in the context of singular spaces. It is based on the workshop Approaches to Singular Analysis which was held on April 8-10 1999 at Humboldt University of Berlin. The aim of this workshop was to bring together young mathematicians interested in partial differential operators on singular configurations. The main idea was to look at different approaches that have been proposed and try to understand to which extent they overlap and how they differ. The workshop took place in a rather relaxed atmosphere. The participants appreciated that there was a discussion session every day which gave a lot of room for an open exchange of ideas. This book contains articles by workshop participants and invited contributions. The former are expanded versions of talks at the workshop they give introductions to various pseudodifferential calculi and discussions of relations between them. In addition we invited a limited number of papers from mathematicians who have made significant contributions to this field. Unfortunately several of these invitations were turned down due to other commitments. For this reason only a very small number of contributions from non participants remain. The absence of any particular name from the list of invited contributors should not be interpreted as a bias of the editors against that scientist. It rather reflects our restricted choice of invitations due to lack of space.

Semiclassical Analysis, Witten Laplacians, And Statistical Mechanics Bernard Helffer, 2002-09-10. This important book explains how the technique of Witten Laplacians may be useful in statistical mechanics. It considers the problem of analyzing the decay of correlations after presenting its origin in statistical mechanics. In addition it compares the Witten Laplacian approach with other techniques such as the transfer matrix approach and its semiclassical analysis. The author concludes by providing a complete proof of the uniform Log Sobolev inequality.
