Science And Modernity Toward An Integral Theory Of Science:

Science and Modernity S. Lelas, 2001-11-30 Science is a multifaceted natural and historical phenomenon It consists of five elements that is it happens in five distinct media biological linguistic technological social and historical None of these alone provides an indubitable basis for the truth of scientific knowledge but combined together they compose a solid ground for our trust in its reliability The composition however is uniquely related to our modern mode of living Science did not exist before modernity and it will cease to exist in this form if our way of life should change The book presents a thorough analysis of all these dimensions and their relations and thus lays the path for an integral theory of science Because of this it can be used as a textbook for general courses in the theory of science at both the undergraduate and graduate level Science and Modernity S. Lelas, 2012-12-06 Science is a multifaceted natural and historical phenomenon It consists of five elements that is it happens in five distinct media biological linguistic technological social and historical None of these alone provides an indubitable basis for the truth of scientific knowledge but combined together they compose a solid ground for our trust in its reliability The composition however is uniquely related to our modern mode of living Science did not exist before modernity and it will cease to exist in this form if our way of life should change The book presents a thorough analysis of all these dimensions and their relations and thus lays the path for an integral theory of science Because of this it can be used as a textbook for general courses in the theory of science at both the undergraduate and graduate level *E.A. Burtt, Historian and Philosopher* D. Villemaire, 2013-04-17 Burtt's book *The Metaphysical Foundations of Modern Physical Science* is something of a puzzle within the context of twentieth century intellectual history especially American intellectual history Burtt's pioneering study of the scientific revolution has proved to prophetic in its rejection of both scientism and positivism Published in 1924 Burtt's book continues to be read in educated circles and remains both the rose and the thorn on university reading lists raising skeptical questions about science methods and science knowledge just as it did seventy five years ago This book examines Burtt's public academic and personal life From his politics of conscience after World War I on through the Cold War Burtt is shown to be a man of unparalleled integrity whose relentless search for philosophic understanding drove his more quixotic philosophical quests and steered his personal life including its tragic dimension toward simple virtue The many who have been affected by *The Metaphysical Foundations* will be especially interested in this new perspective on the life and thought of its author Those who have not read Burtt's books might be inspired to study this unusual American thinker **Ernst Mach's Vienna 1895-1930** J.T. Blackmore, R. Itagaki, S. Tanaka, 2013-03-14 Section Guide 1 Prolegomena 2 Biographical Sketch 3 Epistemology 4 Textbook Ontology 1 PROLEGOMENA While both philosophers and historians almost always love truth and the search for truth and both often carry out extensive research there can be noticeable differences when historians write about the history of philosophy and when philosophers write about it Philosophers often look at the past with categories and interests taken from the present or at the least from the recent past

but many historians especially those who love research for its own sake will try to look at the past from a perspective either from that period or from even earlier Both camps look for roots but view them with different lenses and presuppositions This prolegomena has been added to prepare some philosophers for what will hopefully only be the mildest of shocks for seeing the history of philosophy in a way which does not treat what is recent or latest as best but which loves the context of ideas for its own sake a context which can be very foreign to contemporary likes and dislikes To be sure we historians can deceive ourselves as easily as philosophers but we tend to do so about different things *Rescuing Reason* Robert Nola, 2003-02-28

Do knowledge and science arise from the application of canons of rationality and scientific method Or is all our scientific knowledge caused by socio political factors or by our interests in the socio political the view of sociologists of knowledge Or does it result from interplay of relations of power the view of Michel Foucault Or does our knowledge arise from the will to power the view of Nietzsche This volume sets out to critically examine the theses of those who would debunk the idea of rational explanation The book is wide ranging The theories of method of Quine Kuhn Feyerabend amongst others are discussed and related to the views of Marx Foucault Wittgenstein and Nietzsche as well as sociologists of science such as Mannheim and Bloor The author provides a wide interpretative framework which links the doctrines espoused by many of these authors it is argued that they inherit many of the difficulties in the Strong Programme in the sociology of knowledge and that they fail to reconcile the normativity of knowledge with their naturalism It is argued that neither relativists sceptics nihilists sociologists of knowledge nor the postmodernists successfully debunk the claims of rational explanation far from it these theorists presuppose much of the theory of methodology they deny *The Reality of the Unobservable* E. Agazzi, M. Pauri, 2013-04-17

Observability and Scientific Realism It is commonly thought that the birth of modern natural science was made possible by an intellectual shift from a mainly abstract and speculative conception of the world to a carefully elaborated image based on observations There is some grain of truth in this claim but this grain depends very much on what one takes observation to be In the philosophy of science of our century observation has been practically equated with sense perception This is understandable if we think of the attitude of radical empiricism that inspired Ernst Mach and the philosophers of the Vienna Circle who powerfully influenced our century's philosophy of science However this was not the attitude of the founders of modern science Galileo for example expressed in a famous passage of the Assayer the conviction that perceptual features of the world are merely subjective and are produced in the anima by the motion and impacts of unobservable particles that are endowed uniquely with mathematically expressible properties and which are therefore the real features of the world Moreover on other occasions when defending the Copernican theory he explicitly remarked that in admitting that the Sun is static and the Earth turns on its own axis reason must do violence to the sense and that it is thanks to this violence that one can know the true constitution of the universe *Analogy in Indian and Western Philosophical Thought* David B. Zilberman, 2006-08-02

This book is unusual in many respects It was written by a prolific

author whose tragic untimely death did not allow to finish this and many other of his undertakings It was assembled from numerous excerpts notes and fragments according to his initial plans Zilberman's legacy still awaits its true discovery and this book is a second installment to it after *The Birth of Meaning in Hindu Thought* Kluwer 1988 Zilberman's treatment of analogy is unique in its approach scope and universality for Western philosophical thought Constantly compared to eastern and especially classical Indian interpretations analogy is presented by Zilberman as an important and in many ways primary method of philosophizing or philosophy building Due to its universality this method can be also applied in linguistics logic social analysis as well as historical and anthropological research These applications are integral part of Zilberman's book A prophetic leap to largely uncharted territories this book could be of considerable interest for experts and novices in the field of analogy alike

Travels of Learning Ana Simões, A. Carneiro, M.P. Diogo, 2013-04-17 The idea behind this book grew out of a research project launched by the international group STEP Science and Technology in the European Peripheries established in 1999 by historians of science from Spain Portugal Belgium Greece Turkey Italy Russia Sweden and Denmark The aim has been to re-examine the historical and we might also add the geographical character of science and technology and their institutions in regions and societies within Europe usually outside mainstream historical analysis The intended activities of the group have been framed by the following issues reconsidering the centre periphery model which has been the dominant model in studies on the transfer of scientific knowledge bringing to the fore the concept of scientific appropriation and attempting to study the construction of various local discourses systematically examining the relationship between science politics and the rhetoric of modernisation in societies in the European periphery joining forces to find out more about scientific travels using networks to further understand the dynamics and role of scholars on societies in the periphery of Europe intensifying efforts to catalogue and make available to the international community the archival material in the peripheral countries <http://www.cc.uoa.gr/step> on page 2 As a result of these programmatic guidelines a meeting was held in Lisbon in September 2000 in which the topic of scientific travels was used as a particularly good unifying theme on which to base a discussion of case studies involving the European peripheries

The Reception of Darwinism in the Iberian World T.F Glick, Miguel Angel Puig-Samper, R. Ruiz, 2001-10-31 Twenty five years ago at the Conference on the Comparative Reception of Darwinism held at the University of Texas in 1972 only two countries of the Iberian world Spain and Mexico were represented At the time it was apparent that the topic had attracted interest only as regarded the mainstream science countries of Western Europe plus the United States The Eurocentric bias of professional history of science was a fact The sea change that subsequently occurred in the historiography of science makes 1972 appear something like the antediluvian era Still we would like to think that that meeting was prescient in looking beyond the mainstream science countries as then perceived in order to test the variation that ideas undergo as they pass from center to periphery One thing that the comparative study of the reception of ideas makes abundantly clear however is the weakness of the center periphery

dichotomy from the perspective of the diffusion of scientific ideas Catholics in mainstream countries for example did not handle evolution much better than did their coreligionaries on the fringes Conversely Darwinians in Latin America were frequently better placed to advance Darwin's ideas in a social and political sense than were their fellow evolutionists on the Continent The Texas meeting was also a marker in the comparative reception of scientific ideas Darwinism aside Although by 1972 scientific institutions had been studied comparatively there was no antecedent for the comparative history of scientific ideas

Interactions Vincent F. Hendricks, Klaus F. Jørgensen, Jesper Lützen, Stig A. Pedersen, 2007-01-17 The main theme of this anthology is the unique interaction between mathematics physics and philosophy during the beginning of the 20th century In this book ten renowned philosopher historians probe insightfully into key conceptual questions of pre quantum mathematical physics The result is a diverse yet thematically focused compilation of first class papers on mathematics physics and philosophy and a source book on the interaction between them

Philosophy of Chemistry Davis Baird, Eric Scerri, Lee McIntyre, 2011-09-01 This comprehensive volume marks a new standard in scholarship in the emerging field of the philosophy of chemistry Philosophers chemists and historians of science ask some fundamental questions about the relationship between philosophy and chemistry

Rethinking Explanation Johannes Persson, Petri Ylikoski, 2007-05-16 This volume is a product of the international research project Theory of Explanation which was funded by the Joint Committee for Nordic Research Councils for the Humanities and the Social Sciences NOS HS The project started in 2001 and operated for a period of three years by organizing a number of workshops on scientific explanation in Norway Iceland Sweden and Finland The workshops included presentations by people involved in the project and by invited guests Both groups are represented in this volume which brings together some of the papers presented in these meetings The central theme of the research project was scientific explanation but it was approached from many different angles This plurality of approaches is also visible in the present volume The authors share a joint interest in explanation but not the same theoretical or methodological assumptions As a whole this volume shows that although the theory of explanation has been a major industry within philosophy of science there are still both conceptual problems to be solved and fresh philosophical ideas to explore The papers in this volume have been divided into two broad groups Part 1 consists of papers dealing with general issues in the theory of explanation while the papers in Part 2 focus on some more specific problems Part 1 Theory of Explanation

Tools and Modes of Representation in the Laboratory Sciences U. Klein, 2001-10-31 Fourteen chapters provide insights into the efforts of 19th and 20th century scientists to construct working representations of invisible objects such as the structural formula of a dye a three dimensional model of a protein or a table conveying relationships between chemical elements The essays focus on scientists pragmatic use of representation exploring the concrete ways that scientists implement sign systems as productive tools both to achieve and to shape their organizational goals Editor Klein is associated with the Max Planck Institute for the History of Science Berlin Annotation copyrighted by Book News Inc Portland OR

Knowledge and Language L. Jonathan Cohen, 2002-03-31 This collection of twenty papers deals with a wide range of issues in philosophy of language epistemology history of philosophy philosophy of psychology jurisprudence and philosophy of science It should be of interest to and prove a stimulus for new work by researchers and practitioners working in any of these fields Tracing a route backwards through the papers as presented here the final group is largely concerned with how empirical knowledge may be acquired through evidence in states of uncertainty the middle group explores how such evidence often requires or results in conceptual innovation and is given to us in language the meaning of which may be difficult to determine the first group explores how a theory of meaning can be constructed for natural and artificial languages The papers exhibit a distinctive analytical perspective and a great deal of thematic continuity underpinned by commitment to the richness both of language and of enquiry and opposition to simplistic or dogmatic formalisations and analyses

Leibniz's Metaphysics of Time and Space Michael Futch, 2008-04-05 Leibniz's metaphysics of space and time stands at the centre of his philosophy and is one of the high water marks in the history of the philosophy of science In this work Futch provides the first systematic and comprehensive examination of Leibniz's thought on this subject In addition to elucidating the nature of Leibniz's relationalism the book fills a lacuna in existing scholarship by examining his views on the topological structure of space and time including the unity and unboundedness of space and time It is shown that like many of his more recent counterparts Leibniz adopts a causal theory of time where temporal facts are grounded on causal facts and that his approach to time represents a precursor to non tensed theories of time Futch then goes on to situate Leibniz's philosophy of space and time within the broader context of his idealistic metaphysics and natural theology Emphasizing the historical background of Leibniz's thought the book also places him in dialogue with contemporary philosophy of science underscoring the enduring philosophical interest of Leibniz's metaphysics of time and space

Classics in the History of Greek Mathematics Jean Christianidis, 2013-04-18 The twentieth century is the period during which the history of Greek mathematics reached its greatest acme Indeed it is by no means exaggerated to say that Greek mathematics represents the unique field from the wider domain of the general history of science which was included in the research agenda of so many and so distinguished scholars from so varied scientific communities historians of science historians of philosophy mathematicians philologists philosophers of science archeologists etc while new scholarship of the highest quality continues to be produced This volume includes 19 classic papers on the history of Greek mathematics that were published during the entire 20th century and affected significantly the state of the art of this field It is divided into six self contained sections each one with its own editor who had the responsibility for the selection of the papers that are republished in the section and who wrote the introduction of the section It constitutes a kind of a Reader book which is today one century after the first publications of Tannery Zeuthen Heath and the other outstanding figures of the end of the 19th and the beginning of 20th century rather timely in many respects

Meanest Foundations and Nobler Superstructures Ofer Gal, 2013-11-11 This book

is a historical epistemological study of one of the most consequential breakthroughs in the history of celestial mechanics Robert Hooke's 1635-1703 proposal to compound the celestial motions of the planets of a direct motion by the tangent and an attractive motion towards a central body Newton The Correspondence li 297 Henceforth Correspondence This is the challenge Hooke presented to Isaac Newton 1642-1727 in a short but intense correspondence in the winter of 1679-80 which set Newton on course for his 1687 Principia transforming the very concept of the planetary heavens in the process Herivel 301 De Motu Version III 1 It is difficult to overstate the novelty of Hooke's Programme The celestial motions it suggested those proverbial symbols of stability and immutability wherein fact a process of continuous change a deflection of the planets from original rectilinear paths by a central attractive power Correspondence li 313 There was nothing necessary or essential in the shape of planetary orbits Already known to be not circular nor concentric *ibid* Hooke claimed that these apparently closed curve Lines should be understood and calculated as mere effects of rectilinear motions and rectilinear attraction And as Newton was quick to realize this also implied that the planets neither move exactly in ellipse nor revolve twice in the same orbit so that there are as many orbits to a planet as it has revolutions Herivel 301 De Motu Version III

Observation and Experiment in the Natural and Social Sciences Maria Carla Galavotti, 2006-04-18 According to a long tradition in philosophy of science a clear cut distinction can be traced between a context of discovery and a context of justification This tradition dates back to the birth of the discipline in connection with the Circles of Vienna and Berlin in the twenties and thirties of last century Convicted that only the context of justification is pertinent to philosophy of science logical empiricists identified its goal with the rational reconstruction of scientific knowledge taken as the clarification of the logical structure of science through an analysis of its language and methods Stressing justification as the proper field of application of philosophy of science logical empiricists intended to leave discovery out of its remit The context of discovery was then discarded from philosophy of science and left to sociology psychology and history The distinction between context of discovery and context of justification goes hand in hand with the tenet that the theoretical side of science can and should be kept separate from its observational and experimental components Further the final abstract formulation of theories should be analysed apart from the process behind it resulting from a tangle of context dependent factors This conviction is reflected by the distinction between theoretical and observational sentences underpinning the Hempelian view of theories as nets whose knots represent theoretical terms floating on the plane of observation to which it is anchored by rules of interpretation

From Commodification to the Common Good Hans Radder, 2019-08-16 The commodification of science often identified with commercialization or the selling of expertise and research results and the capitalization of knowledge in academia and beyond has been investigated as a threat to the autonomy of science and academic culture and criticized for undermining the social responsibility of modern science In *From Commodification to the Common Good* Hans Radder revisits the commodification of the sciences from a philosophical perspective to focus instead on a potential alternative the notion of

public interest science Scientific knowledge he argues constitutes a common good only if it serves those affected by the issues at stake irrespective of commercial gain Scrutinizing the theory and practices of scientific and technological patenting Radder challenges the legitimacy of commercial monopolies and the private appropriation and exploitation of research results His book invites us to reevaluate established laws and to question doctrines and practices that may impede or even prohibit scientific research and social progress so that we might achieve real and significant transformations in service of the common good *Mechanics and Natural Philosophy before the Scientific Revolution* Walter Roy Laird, Sophie

Roux, 2008-01-01 Modern mechanics was forged in the seventeenth century from materials inherited from Antiquity and transformed in the period from the Middle Ages through to the sixteenth century These materials were transmitted through a number of textual traditions and within several disciplines and practices including ancient and medieval natural philosophy statics the theory and design of machines and mathematics This volume deals with a variety of moments in the history of mechanics when conflicts arose within one textual tradition between different traditions or between textual traditions and the wider world of practice Its purpose is to show how the accommodations sometimes made in the course of these conflicts ultimately contributed to the emergence of modern mechanics The first part of the volume is concerned with ancient mechanics and its transformations in the Middle Ages the second part with the reappropriation of ancient mechanics and especially with the reception of the Pseudo Aristotelian *Mechanica* in the Renaissance and the third and final part with early modern mechanics in specific social national and institutional contexts
