Computer Networking for Systems Programmers Gerald D. Cole, 1990-09-26 For all computer and systems programmers analysts system engineers and students this book is your essential guide to address the special problems of networking with all the inside tips and tricks for building and maintaining software for clean flexible and efficient data transfer Written by an expert in the field the book presents the major topic of data communications and networking from a computer programmer's perspective It tells you all you need to know for programming what data communications hardware does how data communication software works what protocols are all about and how to implement debug test and optimize the associated protocols as computer programs and software With a breadth of coverage that makes it quite unique and valuable it focuses on what you need to know to write networking programs based on real world examples 9 Allows system programmers to ramp up very quickly to produce data communications and networking software 9 Explains how to specify data communications and networking requirements 9

Develops a good software oriented understanding of data communications and networking technology requirements and implementation limitations 9 Offers real world examples of software systems including helpful lessons learned from protocols as computer programs Simulation of Local Area Networks Matthew N. O. Sadiku, 2018-01-18 A fast growing area in the communications industry is the internetworking of an ever increasing proliferation of computers particularly via local area networks LANs The LAN is a resource sharing data communications network being used by many offices to interchange information such as electronic mail word processing and files among computers and other devices This unique book shows the user how to establish the performance characteristics of a LAN before putting it to use in a particular type of situation Simulation of Local Area Networks consists of eight chapters each with its own extensive list of references The first chapter provides a brief review of local area networks and the second chapter gives the analytical models of popular LANs token passing bus and ring networks CSMA CD LANs and star networks Chapter 3 covers general principles of simulation and Chapter 4 discusses fundamental concepts in probability and statistics relating to simulation modeling Materials in Chapters 3 and 4 are specifically applied in developing simulation models on token passing LANs CSMA CD LANs and star LANs in Chapters 5 through 7 The computer code in Chapters 5 6 and 7 is divided into segments and a detailed explanation of each segment is provided The last chapter reviews special purpose languages such as GPSS SIMSCRIPT GASP SIMULA SLAM and RESQ Helpful criteria for language selection are included The entire code is put together in the appendixes This book has two major advantages over existing texts First it uses C a well developed general purpose language that is familiar to most analysts Second the text specifically applies the simulation principles to local area networks No other book available shows the systems analyst how to evaluate the performance of existing or proposed systems under different kinds of conditions
