Mathematical Theory Of Incompressible Non Viscous Fluids:

Mathematical Theory of Incompressible Nonviscous Fluids Carlo Marchioro, Mario Pulvirenti, 1993-11-05 Fluid dynamics is an ancient science incredibly alive today Modern technology and new needs require a deeper knowledge of the behavior of real fluids and new discoveries or steps forward pose quite often challenging and difficult new mathematical problems In this framework a special role is played by incompressible nonviscous sometimes called perfect flows This is a mathematical model consisting essentially of an evolution equation the Euler equation for the velocity field of fluids Such an equation which is nothing other than the Newton laws plus some additional structural hypotheses was discovered by Euler in 1755 and although it is more than two centuries old many fundamental questions concerning its solutions are still open In particular it is not known whether the solutions for reasonably general initial conditions develop singularities in a finite time and very little is known about the long term behavior of smooth solutions These and other basic problems are still open and this is one of the reasons why the mathematical theory of perfect flows is far from being completed Incompressible flows have been attached by many distinguished mathematicians with a large variety of mathematical techniques so that today this field constitutes a very rich and stimulating part of applied mathematics

Stochastic Partial Differential Equations in Fluid Mechanics Franco Flandoli, Eliseo Luongo, 2023-06-11 This book is devoted to stochastic Navier Stokes equations and more generally to stochasticity in fluid mechanics The two opening chapters describe basic material about the existence and uniqueness of solutions first in the case of additive noise treated pathwise and then in the case of state dependent noise The main mathematical techniques of these two chapters are known and given in detail for using the book as a reference for advanced courses By contrast the third and fourth chapters describe new material that has been developed in very recent years or in works now in preparation The new material deals with transport type noise its origin and its consequences on dissipation and well posedness properties Finally the last chapter is devoted to the physical intuition behind the stochastic modeling presented in the book giving great attention to the question of the origin of noise in connection with small scale turbulence its mathematical form and its consequences on large scale properties of a fluid

Navier—Stokes Equations and Related Nonlinear Problems Adélia Sequeira, 2013-11-11 This volume contains the Proceedings of the Third International Conference on Navier Stokes Equations and Related Nonlinear Problems The conference was held in Funchal Madeira Portugal on May 21 27 1994 In addition to the editor the organizers were Carlos Albuquerque FC University of Lisbon Casimiro Silva University of Madeira and Juha Videman 1ST Technical University of Lisbon This meeting following two other

successful events of similar type held in Thurnau Germany in 1992 and in Cento Italy in 1993 brought together to the majestically beautiful island of Madeira more than 60 specialists from all around the world of which about two thirds were invited lecturers The main interest of the meeting was focused on the mathematical analysis of nonlinear phenomena in fluid mechanics During the conference we noticed that this area seems to provide today more than ever challenging and increasingly important problems motivating the research of both theoretical and numerical analysts This volume collects 32 articles selected from the invited lectures and contributed papers given during the conference The main topics covered include Flows in Unbounded Domains Flows in Bounded Domains Compressible Fluids Free Boundary Problems Non Newtonian Fluids Related Problems and Numerical Approximations The contributions present original results or new surveys on recent developments giving directions for future research I express my gratitude to all the authors and I am glad to recognize the scientific level and the actual interest of the articles

Partial Differential Equations in Fluid Mechanics

Charles L. Fefferman, James C. Robinson, José L. Rodrigo, 2018-09-27 The Euler and Navier Stokes equations are the fundamental mathematical models of fluid mechanics and their study remains central in the modern theory of partial differential equations This volume of articles derived from the workshop PDEs in Fluid Mechanics held at the University of Warwick in 2016 serves to consolidate survey and further advance research in this area It contains reviews of recent progress and classical results as well as cutting edge research articles Topics include Onsager's conjecture for energy conservation in the Euler equations weak strong uniqueness in fluid models and several chapters address the Navier Stokes equations directly in particular a retelling of Leray's formative 1934 paper in modern mathematical language The book also covers more general PDE methods with applications in fluid mechanics and beyond This collection will serve as a helpful overview of current research for graduate students new to the area and for more established researchers

Theory of Multicomponent Fluids Donald A. Drew, Stephen L. Passman, 2006-05-10 In this book we give a rational treatment of multicomponent materials as interacting continua We offer two derivations of the equations of motion for the interacting continua one which uses the concepts of continua for the components and one which applies an averaging operation to the continuum equations for each component Arguments are given for constitutive equations appropriate for dispersed multicomponent flows The forms of the constitutive equations are derived from the principles of continuum mechanics applied to the components and their interactions The solutions of problems of hydromechanics of ordinary continua are used as motivation for the forms of certain constitutive equations in multicomponent materials The balance of the book is devoted to the study of problems of hydrodynamics of multicomponent flows Many materials are homogeneous in the sense that each part of the material has the same response to a given set of stimuli as all of the other parts An example of such a material is pure water Formulation of equations describing the behavior of homogeneous materials is well understood and is described in numerous standard textbooks Many other materials both manufactured and occurring in nature are not homogeneous Such materials are often
