Mathematics of Data Fusion I.R. Goodman,R.P. Mahler,Hung T. Nguyen,1997-08-31 Data fusion or information fusion are names which have been primarily assigned to military oriented problems In military applications typical data fusion problems are multisensor multitarget detection object identification tracking threat assessment mission assessment and mission planning among many others However it is clear that the basic underlying concepts underlying such fusion procedures can often be used in nonmilitary applications as well The purpose of this book is twofold First to point out present gaps in the way data fusion problems are conceptually treated Second to address this issue by exhibiting mathematical tools which treat combination of evidence in the presence of uncertainty in a more systematic and comprehensive way These techniques are based essentially on two novel ideas relating to probability theory the newly developed fields of random set theory and conditional and relational event algebra This volume is intended to be both an update on research progress on data fusion and an introduction to potentially powerful new techniques fuzzy logic random set theory and conditional and relational event algebra Audience This volume can be used as a reference book for researchers and practitioners in data fusion or expert systems theory or for graduate students as text for a research seminar or graduate level course Mathematical Techniques in Multisensor Data Fusion David Lee Hall,Sonya A. Shahbazian,E. Waltz,2002-07-31 For some time all branches of the military have used a wide range of sensors to provide data for many purposes including surveillance reconnoitring target detection and battle damage assessment Many nations have also attempted to utilise these sensors for civilian applications such as crop monitoring agricultural disease tracking environmental diagnostics cartography ocean temperature profiling urban planning and the characterisation of the Ozone Hole above Antarctica The recent convergence of several important technologies has made possible new advanced high performance sensor based applications relying on the near simultaneous fusion of data from an ensemble of different types of sensors The book examines the underlying principles of sensor operation and data fusion the techniques and technologies that enable the process including the operation of fusion engines Fundamental theory and the enabling technologies of data fusion are presented in a systematic and accessible manner Applications are discussed in the areas of medicine meteorology BDA and targeting transportation cartography the environment agriculture and manufacturing and process control

**Multisensor Data Fusion** Edward Waltz,James Llinas,1990 Explains numeric and symbolic approaches to data association tracking combination classification and situation assessment and provides an overview of data fusion theory and mathematical formalisms Advanced Mathematical & Computational Tools in Metrology V P. Ciarlini,2001 Advances in metrology depend on improvements in scientific and technical knowledge and in instrumentation quality as well as on better use of advanced mathematical tools and development of new ones In this volume scientists from both the mathematical and the metrological fields exchange their experiences Industrial sectors such as instrumentation and software will benefit from this exchange since metrology has a high impact on the overall quality of industrial products and applied mathematics is becoming more and more important in industrial processes This book is of interest to people in universities research centers and industries who are involved in measurements and need advanced mathematical tools to solve their problems and also to those developing such mathematical tools *Multi-modal Data Fusion based on Embeddings* S. Thoma,2019-11-06 Many web pages include structured data in the form of semantic markup which can be transferred to the Resource Description Framework RDF or provide an interface to retrieve RDF data directly This RDF data enables machines to automatically process and use the data When applications need data from more than one source the data has to be integrated and the automation of this can be challenging Usually vocabularies are used to concisely describe the data but because of the decentralized nature of the web multiple data sources can provide similar information with different vocabularies making integration more difficult This book Multi modal Data Fusion based on Embeddings describes how similar statements about entities can be identified across sources independent of the vocabulary and data modeling choices Previous approaches have relied on clean and extensively modeled ontologies for the alignment of statements but the often noisy data in a web context does not necessarily adhere to these prerequisites In this book the use of RDF label information of entities is proposed to tackle this problem In combination with embeddings the use of label information allows for a better integration of noisy data

something that has been empirically confirmed by experiment The book presents two main scientific contributions the vocabulary and modeling agnostic fusion approach on the purely textual label information and the combination of three different modalities into one multi modal embedding space for a more human like notion of similarity The book will be of interest to all those faced with the problem of processing data from multiple web based sources Statistical Data Fusion Benjamin Kede,Victor De Oliveira,Michael Sverchkov,2017-01-24 The book provides a comprehensive review of the DRM approach to data fusion It is well written and easy to follow although the technical details are not trivial The authors did an excellent job in making a concise introduction of the statistical techniques in data fusion The book contains several real data Overall I found that the book covers an important topic and the DRM is a promising tool in this area Researchers on data fusion will surely find this book very helpful and I will use this book in studying with my PhD students Journal of the American Statistical Association This book comes up with estimates or decisions based on multiple data sources as opposed to more narrowly defined estimates or decisions based on single data sources And as the world is awash with data obtained from numerous and varied processes there is a need for appropriate statistical methods which in general produce improved inference by multiple data sources The book contains numerous examples useful to practitioners from genomics Topics range from sensors radars to small area estimation of body mass to the estimation of small tail probabilities to predictive distributions in time series analysis *ITS Sensors and Architectures for Traffic Management and Connected Vehicles* Lawrence A. Klein,2017-08-07 An intelligent transportation system ITS offers considerable opportunities for increasing the safety efficiency and predictability of traffic flow and reducing vehicle emissions Sensors or detectors enable the effective gathering of arterial and controlled access highway information in support of automatic incident detection active transportation and demand management traffic adaptive signal control and ramp and freeway metering and dispatching of emergency response providers As traffic flow sensors are integrated with big data sources such as connected and cooperative vehicles and cell phones and other Bluetooth enabled devices more accurate and timely traffic flow information can be obtained The book examines the roles of traffic management centers that serve cities counties and other regions and the collocation issues that ensue when multiple agencies share the same space It describes sensor applications and data requirements for several ITS strategies sensor technologies sensor installation initialization and field testing procedures and alternate sources of traffic flow data The book addresses concerns related to the introduction of automated and connected vehicles and the benefits that systems engineering and national ITS architectures in the US Europe Japan and elsewhere bring to ITS Sensor and data fusion benefits to traffic management are described while the Bayesian and Dempster Shafer approaches to data fusion are discussed in more detail ITS Sensors and Architectures for Traffic Management and Connected Vehicles suits the needs of personnel in transportation institutes and highway agencies and students in undergraduate or graduate transportation engineering courses **Mathematics in Signal Processing** V J. Stone, Roy L.

Streit, Thomas L. Corwin, Kristine L. Bell, 2013-12-01 This second edition has undergone substantial revision from the 1999 first edition recognizing that a lot has changed in the multiple target tracking field One of the most dramatic changes is in the widespread use of particle filters to implement nonlinear non Gaussian Bayesian trackers This book views multiple target tracking as a Bayesian inference problem Within this framework it develops the theory of single target tracking multiple target tracking and likelihood ratio detection and tracking In addition to providing a detailed description of a basic particle filter that implements the Bayesian single target recursion this resource provides numerous examples that involve the use of particle filters With these examples illustrating the developed concepts algorithms and approaches the book helps radar engineers develop tracking solutions when observations are non linear functions of target state when the target state distributions or measurement error distributions are not Gaussian in low data rate and low signal to noise ratio situations and when notions of contact and association are merged or unresolved among more than one target
