Moments in Mathematics Henry J. Landau, American Mathematical Society, 1987 Function theory spectral decomposition of operators probability approximation electrical and mechanical inverse problems prediction of stochastic processes the design of algorithms for signal processing VLSI chips these are among a host of important theoretical and applied topics illuminated by the classical moment problem To survey some of these ramifications and the research which derives from them the AMS sponsored the Short Course Moments in Mathematics at the Joint Mathematics Meetings held in San Antonio Texas in January 1987 This volume contains the six lectures presented during that course The papers are likely to find a wide audience for they are expository but nevertheless lead the reader to topics of current research In his paper Henry J Landau sketches the main ideas of past work related to the moment problem by such mathematicians as Caratheodory Herglotz Schur Riesz and Krein and describes the way the moment problem has interconnected so many diverse areas of research J H B Kemperman examines the moment problem from a geometric viewpoint which involves a certain natural duality method and leads to interesting applications in linear programming measure theory and dilations Donald Sarason first provides a brief review of the theory of unbounded self adjoint operators then goes on to sketch the operator theoretic treatment of the Hamburger problem and to discuss Hankel operators the Adamjan Arov Krein approach and the theory of unitary dilations Exploring the interplay of trigonometric moment problems and signal processing Thomas Kailath describes the role of Szego polynomials in linear predictive coding methods parallel implementation one dimensional inverse scattering problems and the Toeplitz moment matrices Christian Berg contrasts the multi dimensional moment problem with the one dimensional theory and shows how the theory of the moment problem may be viewed as part of harmonic analysis on semigroups Starting from a historical survey of the use of moments in probability and statistics Persi Diaconis illustrates the continuing vitality of these methods in a variety of recent novel problems drawn from such areas as Wiener Ito integrals random graphs and matrices Gibbs ensembles cumulants and self similar processes projections of high dimensional data and empirical estimation

computational tests for existence and uniqueness of representing measures μ in the Truncated Complex Moment Problem
 $\gamma_{ij} = \int z^i \bar{z}^j d\mu$, $0 \leq i, j \leq 2n$. Conditions for the existence of finitely atomic representing measures are expressed in terms of positivity and extension properties of the moment matrix $M_n(\gamma)$ associated with γ .
 $M_n(\gamma) = (\gamma_{ij})_{0 \leq i, j \leq n}$. $M_n(\gamma) \succeq 0$ is necessary for the existence of a representing measure. If $M_n(\gamma) \succeq 0$ and $\gamma_{00} > 0$, then $M_n(\gamma)$ is associated with a representing measure. This study includes new conditions for flat extensions M_{n+1} of M_n . Each such extension corresponds to a distinct rank M_n atomic representing measure and each such measure is minimal among representing measures in terms of the cardinality of its support. For a natural class of moment matrices satisfying the tests of recursive generation, recursive consistency and normal consistency, the existence problem for minimal representing measures is reduced to the solubility of small systems of multivariable algebraic equations. In a variety of applications including cases of the quartic moment problem, the text includes explicit constructions of minimal representing measures via the theory of flat extensions. Additional computational tests are used to prove non-existence of representing measures or the non-existence of minimal representing measures. These tests are used to illustrate in very concrete terms new phenomena associated with higher dimensional moment problems that do not appear in the classical one-dimensional moment problem.

Iterated Function Systems, Moments, and Transformations of Infinite Matrices

Palle E. T. Jørgensen, Keri A. Kornelson, Karen L. Shuman, 2011. The authors study the moments of equilibrium measures for iterated function systems (IFSs) and draw connections to operator theory. Their main object of study is the infinite matrix which encodes all the moment data of a Borel measure on \mathbb{R}^d or \mathbb{C}^d . To encode the salient features of a given IFS into precise moment data, they establish an interdependence between IFS equilibrium measures, the encoding of the sequence of moments of these measures into operators, and a new correspondence between the IFS moments and this family of operators in Hilbert space. For a given IFS, the authors aim is to establish a functorial correspondence in such a way that the geometric transformations of the IFS turn into transformations of moment matrices or rather transformations of the operators that are associated with them.

universities research institutes colleges and even schools *Mathematics and Transition to School* Bob Perry, Amy MacDonald, Ann Gervasoni, 2015-01-09 This edited book brings together for the first time an international collection of work focused on two important aspects of any young child's life learning mathematics and starting primary or elementary school. The chapters take a variety of perspectives and integrate these two components in sometimes explicit and sometimes more subtle ways. The key issues and themes explored in this book are the mathematical and other strengths that all participants in the transition to school bring to this period of a child's life, the opportunities provided by transition to school for young children's mathematics learning, the importance of partnerships among adults and among adults and children for effective school transitions and mathematics learning and teaching, the critical impact of expectations on their mathematics learning as children start school, the importance of providing children with meaningful challenging and relevant mathematical experiences throughout transition to school, the entitlement of children and educators to experience assessment and instructional pedagogies that match the strengths of the learners and the teachers, the importance for the aspirations of children, families, communities, educators and educational organisations to be recognised as legitimate and key determinants of actions, experiences and successes in both transition to school and mathematics learning, and the belief that young children are powerful mathematics learners who can demonstrate this power as they start school. In each chapter authors reflect on their work in the area of mathematics and transition to school, place that work within the overall context of research in these fields, predict the trajectory of this work in the future and consider the implications of the work both theoretically and practically.

World Women in Mathematics 2018 Carolina Araujo, Georgia Benkart, Cheryl E. Praeger, Betül Tanbay, 2019-11-16 The first World Meeting for Women in Mathematics WM 2 was a satellite event of the International Congress of Mathematicians ICM 2018 in Rio de Janeiro. With a focus on Latin America, the first WM 2 brought together mathematicians from all over the world to celebrate women mathematicians and also to reflect on gender issues in mathematics, challenges, initiatives and perspectives for the future. Its activities were complemented by a panel discussion organized by the Committee for Women in Mathematics CWM of the International Mathematical Union IMU inside the ICM 2018 entitled 'The gender gap in mathematical and natural sciences from a historical perspective'. This historical proceedings book, organized by CWM in coordination with the Association for Women in Mathematics, records the first WM 2 and the CWM panel discussion at ICM 2018. The first part of the volume includes a report of activities with pictures of the first WM 2 and a tribute to Maryam Mirzakhani, the first woman to be awarded the Fields medal. It also comprises survey research papers from invited lecturers which provide panoramic views of different fields in pure and applied mathematics. The second part of the book contains articles from the panelists of the CWM panel discussion which consider the historical context of the gender gap in mathematics. It includes an analysis of women lecturers in the ICM since its inception. This book is dedicated to the memory of Maryam Mirzakhani.
