Modeling Software Markets Empirical Analysis Network Simulations And Marketing Implications Information Age Economy S:

Modeling Software Markets Falk von Westarp, 2003-01-22 This book identifies the relevant determinants of modern software markets and incorporates these in a simulation model that provides the basis for an integrated theory of software markets The novel approach overcomes the deficiencies of existing approaches such as Network Effect Theory or Models of Network Diffusion which do not sufficiently explain the phenomena of modern software markets Here the focus is on software for data manipulation storage and or transmission in the corporate world Based on a study of the largest 1000 German and US companies the author presents a comparative analysis of the market for enterprise resource planning systems Electronic Data Interchange EDI solutions and office communication applications By integrating empirical theoretical and simulation results von Westarp provides buyers and sellers of software products with valuable and insightful managerial advice

Modeling Software Markets Falk Graf Westarp, 2012-12-06 As social beings humans are not living in isolation but rather interact and communicate within their social network via language meant to convey parts of some conceptualization from the sender to a single recipient or a set of recipients Communities of agents not only share a common language but also the individual conceptualizations of the world real and abstract have to overlap to a significant extent allowing for efficient reference to whole conceptual structures like the German constitution game theory or medical sciences For societies of interacting technical devices or software agents the situation is not quite as Babylonian since although these agents are meant to act individually and also have a private state and private knowledge in most cases they are designed to refer to one common ontology or standardized protocol and thus do not have to deal with misunderstanding However the more these systems become interconnected the more this situation resembles the one described for societies of human agents even though the misunderstanding might be easier to detect when the different reference ontologies are made explicit and published Obviously in both cases standardization of a common language or set of rules for interaction reduces the individual degree of freedom for the sake of compatibility and benefits derived from interaction In his work Falk Graf von Westarp addresses the software market as a domain strongly depending on compatibility effects of the individuals decisions

On the one hand, economies focused on escalated production levels, proliferating non-renewable energy consumption and reducing energy productivity, leading to production-based carbon dioxide (CO₂) emissions. On the other hand, international trade of high CO₂ emissions embedded goods has skyrocketed the consumption-based CO₂ emissions. Since production and consumption-based CO₂ emissions challenge environmental sustainability, there is an urgent need to pursue sustainable production and consumption to realize the United Nations Sustainable Development Goals (SDGs) dream. In this regard, eco-innovation came into play to transition the conventional production setup to a cleaner production mode. Eco-innovation involves all types of technological advancements extending contributions to the SDGs. In this regard, climate technologies and environmental technologies involving renewable energy, e.g., wind, solar, biogas, energy-efficient technologies, e.g., energy-efficient electric appliances, environmental pollution reduction technologies, e.g., carbon scrubbing filters, water purifiers, waste mitigation technologies, play a tremendous role in mitigating climatic adversities and environmental unsustainabilities. By contributing to the responsible use of natural capital, eco-innovation facilitates efficient energy utilization, improving energy productivity as well as environmental sustainability. Moreover, eco-innovation has the inherent potential to aggravate sustainable production modes through green productivity, a tool to enhance industrial outputs with fewer harms to the environment. As a progressive move, green productivity growth promotes a new trend of producing more economic output by consuming fewer resources and safeguarding ecosystems. The mainstream empirical literature substantiated that eco-innovation and green productivity remained critical players in limiting CO₂ emissions and promoting environmental sustainability. Literature also witnessed that eco-innovation ameliorated energy

productivity by motivating the countries to adopt cost saving and environmentally friendly technologies. On the contrary, the rebound effect supported the environmental deterioration impact of such technologies. Against this backdrop, this Research Topic will provide an opportunity to further delve into the influencing mechanisms triggered by eco innovation and green productivity growth on energy productivity and environmental sustainability for a futuristic perspective of sustainable production and consumption. This Research Topic welcomes theoretical and empirical original research articles and reviews. Research themes and areas include but are not limited to the following: Links between eco innovation, green productivity growth, and energy productivity for sustainable production; Climate technologies and carbon neutrality applications for sustainable production; Firm level environment related innovation practices; Renewable and energy efficient industrial transition for sustainable production; Eco innovation through the firm life cycle for sustainable production and consumption; Green innovation driven business models for sustainable production; Climate technology driven policies for sustainable production and consumption; Eco innovation and zero emissions agenda implementation.
