Modern Methods Of Speech Processing:

Modern Methods of Speech Processing Ravi P. Ramachandran, Richard Mammone, 2012-12-06 The term speech processing refers to the scientific discipline concerned with the analysis and processing of speech signals for getting the best benefit in various practical scenarios These different practical scenarios correspond to a large variety of applications of speech processing research Examples of some applications include enhancement coding synthesis recognition and speaker recognition A very rapid growth particularly during the past ten years has resulted due to the efforts of many leading scientists The ideal aim is to develop algorithms for a certain task that maximize performance are computationally feasible and are robust to a wide class of conditions The purpose of this book is to provide a cohesive collection of articles that describe recent advances in various branches of speech processing The main focus is in describing specific research directions through a detailed analysis and review of both the theoretical and practical settings The intended audience includes graduate students who are embarking on speech research as well as the experienced researcher already working in the field For graduate students taking a course this book serves as a supplement to the course material As the student focuses on a particular topic the corresponding set of articles in this book will serve as an initiation through exposure to research issues and by providing an extensive reference list to commence a literature survey Experienced researchers can utilize this book as a reference guide and can expand their horizons in this rather broad area

Contemporary Methods for Speech Parameterization Todor Ganchev, 2011-08-10 *Contemporary Methods for Speech Parameterization* offers a general view of short time cepstrum based speech

parameterization and provides a common ground for further in depth studies on the subject Specifically it offers a comprehensive description comparative analysis and empirical performance evaluation of eleven contemporary speech parameterization methods which compute short time cepstrum based speech features Among these are five discrete wavelet packet transform DWPT based six discrete Fourier transform DFT based speech features and some of their variants which have been used on the speech recognition speaker recognition and other related speech processing tasks The main similarities and differences in their computation are discussed and empirical results from performance evaluation in common experimental conditions are presented The recognition accuracy obtained on the monophone recognition continuous speech recognition and speaker recognition tasks is contrasted against the one obtained for the well known and widely used Mel Frequency Cepstral Coefficients MFCC It is shown that many of these methods lead to speech features that do offer competitive performance on a certain speech processing setup when compared to the venerable MFCC The last does not target the promotion of certain speech features but instead aims to enhance the common understanding about the advantages and disadvantages of the various speech parameterization techniques available today and to provide the basis for selection of an appropriate speech parameterization in each particular case

Computer-Aided Design Techniques for Low Power Sequential Logic Circuits José Monteiro, Srinivas Devadas, 2012-12-06 Rapid increases in chip complexity increasingly faster clocks and the proliferation of portable devices have combined to make power dissipation an important design parameter The power consumption of a digital system determines its heat dissipation as well as battery life For some systems power has become the most critical design constraint Computer Aided Design Techniques for Low Power Sequential Logic Circuits presents a methodology for low power design The authors first present a survey of techniques for estimating the average power dissipation of a logic circuit At the logic level power dissipation is directly related to average switching activity A symbolic simulation method that accurately computes the average switching activity in logic circuits is then described This method is extended to handle sequential logic circuits by modeling correlation in time and by calculating the probabilities of present

state lines Computer Aided Design Techniques for Low Power Sequential Logic Circuits then presents a survey of methods to optimize logic circuits for low power dissipation which target reduced switching activity A method to retiming a sequential logic circuit where registers are repositioned such that the overall glitching in the circuit is minimized is also described The authors then detail a powerful optimization method that is based on selectively precomputing the output logic values of a circuit one clock cycle before they are required and using the precomputed value to reduce internal switching activity in the succeeding clock cycle Presented next is a survey of methods that reduce switching activity in circuits described at the register transfer and behavioral levels Also described is a scheduling algorithm that reduces power dissipation by maximizing the inactivity period of the modules in a given circuit Computer Aided Design Techniques for Low Power Sequential Logic Circuits concludes with a summary and directions for future research

Advanced Concepts in Adaptive Signal

Processing W. Kenneth Jenkins, Andrew W. Hull, Jeffrey C. Strait, Bernard A. Schnaufer, Xiaohui Li, 2012-12-06 Although adaptive filtering and adaptive array processing began with research and development efforts in the late 1950 s and early 1960 s it was not until the publication of the pioneering books by Honig and Messerschmitt in 1984 and Widrow and Stearns in 1985 that the field of adaptive signal processing began to emerge as a distinct discipline in its own right Since 1984 many new books have been published on adaptive signal processing which serve to define what we will refer to throughout this book as conventional adaptive signal processing These books deal primarily with basic architectures and algorithms for adaptive filtering and adaptive array processing with many of them emphasizing practical applications Most of the existing textbooks on adaptive signal processing focus on finite impulse response FIR filter structures that are trained with strategies based on steepest descent optimization or more precisely the least mean square LMS approximation to steepest descent While literally hundreds of archival research papers have been published that deal with more advanced adaptive filtering concepts none of the current books attempt to treat these advanced concepts in a unified framework The goal of this new book is to present a number of important but not so well known topics that currently exist scattered in the research literature The book also documents some new results that have been conceived and developed through research conducted at the University of Illinois during the past five years
