Depositional Sedimentary Environments H.-E. Reineck, I.B. Singh, 2012-12-06 From the reviews This is an extremely useful reference text for the sedimentary geologist to own It is well produced with clear illustrations and text and gives excellent factual information on a large number of topics Palaeogeography Palaeoclimatology Palaeoecology represents a significant contribution to the literature of geoscience It should be in the library of anyone seriously interested in sedimentology Marine Geology This book is still unsurpassed in providing a good basic synthesis of modern sedimentary environments especially the physical attributes of the deposits being formed and the processes responsible Sedimentary Geology

Mechanics of Wind-blown Sand Movements Xiaojing Zheng, 2009-04-16 Mechanics plays a fundamental role in aeolian processes and other environmental studies This proposed book systematically presents the new progress in the research of aeolian processes especially in the research on mechanism theoretical modelling and computational simulation of aeolian processes from the viewpoint of mechanics Nowadays environmental and aeolian process related problems are attracting more and more attention We hope this proposed book will provide scientists and graduate students in aeolian research and other environmental research some mechanical methods and principles and introduce aeolian related problems of environment to mathematical and mechanical scientists

Aeolian Sand and Sand Dunes, 2008-11-14 It is more than half a century since the publication of R A Bagnold s classic book The physics of blown sand and desert dunes and it is a tribute to the quality of Bagnold s work that many of the fundamental principles which he developed main valid today His book continues to be essential reading for any serious student of aeolian processes However the past two decades have seen an explosion in the scale of research dealing with aeolian transport processes sediments and landforms Some of this work has been summarized in review papers and edited conference proceedings but this book provides the first attempt to review the whole field of aeolian sand research Inevitably it has not been possible to cover all aspects in equal depth and the balance of included material naturally reflects the authors own interests to a significant degree However our aim has been to provide as broad a perspective as possible and to provide an entry point to an extensive multidisciplinary scientific literature some of which has not been given the attention it deserves in earlier textbooks and review papers Many examples are drawn from

existing published work but the book also makes extensive use of our own research in the Middle East Australia Europe and North America The book has been written principally for use by advanced undergraduates po graduates and more senior research workers in geomorphology and sedimentology

Wind as a Geological Process Ronald Greeley,James D. Iversen,1987-08-28 This book gives an account of geological aspects of windblown material Aeolian processes play an important role in modifying the surface of the Earth and they are also active on Mars Additionally they are thought to occur on Venus and possibly Titan as well The authors describe the following aspects wind as a geological process the aeolian environment physics of particle motion aeolian abrasion and erosion aeolian sand deposits and bedforms interaction of wind and topography and windblown dust A particular strength of the book is that it deals with aeolian processes in a planetary context rather than as a purely terrestrial phenomenon In so doing the authors ably demonstrate how we can gain better understanding of the Earth through comparative planetology This paperback reissue will enable the book to be used as a text for advanced students in planetary science Special terms are defined when they are first used There is a glossary and an exhaustive bibliography

Principles of Stratigraphy Amadeus William Grabau,1924

A Practical Approach to Sedimentology Roy Lindholm,2012-12-06 This book is designed for a one semester course in sedimentology taken by advanced undergraduate or graduate students It gives detailed descriptions of sedimentary features and the analytical methods used to evaluate them and is intended to support and reinforce principles presented in lectures Discussion of principles and processes is found in complimentary texts such as Leeder s 1982 Sedimentology process and product and selected readings in professional journals This book is not an exhaustive treatise of laboratory techniques and theory The subject matter includes topics generally covered in courses entitled Sedimentology or Sedimentation Sandstone and carbonate petrography is commonly given in a separate course Furthermore this topic is covered in several current texts For these reasons I have omitted petrographic methods with the exception of those applying to heavy minerals I have included a rather extensive discussion of heavies because this topic is generally lacking in most modern texts Every course in sedimentology is highly individualistic and material covered varies with the interests background and point of view of the instructor For these reasons some topics presented in this book are not necessarily covered in all courses Similarly some instructors may find that their favorite topic is missing I can only hope that this problem is minimal Several chapters contain precise exercises to be completed by the student Some must be done in the classroom where specimens are available for study Others may be done outside of the classroom

Fundamentals of Geomorphology Richard John Huggett,2011-03-15 This extensively revised restructured and updated edition continues to present an engaging and comprehensive introduction to the subject exploring the world s landforms from a broad systems perspective It covers the basics of Earth surface forms and processes while reflecting on the latest developments in the field Fundamentals of Geomorphology begins with a consideration of the nature of geomorphology process and form history and geomorphic

systems and moves on to discuss structure structural landforms associated with plate tectonics and those associated with volcanoes impact craters and folds faults and joints process and form landforms resulting from or influenced by the exogenic agencies of weathering running water flowing ice and meltwater ground ice and frost the wind and the sea landforms developed on limestone and landscape evolution a discussion of ancient landforms including palaeosurfaces stagnant landscape features and evolutionary aspects of landscape change This third edition has been fully updated to include a clearer initial explanation of the nature of geomorphology of land surface process and form and of land surface change over different timescales The text has been restructured to incorporate information on geomorphic materials and processes at more suitable points in the book Finally historical geomorphology has been integrated throughout the text to reflect the importance of history in all aspects of geomorphology Fundamentals of Geomorphology provides a stimulating and innovative perspective on the key topics and debates within the field of geomorphology Written in an accessible and lively manner it includes guides to further reading chapter summaries and an extensive glossary of key terms The book is also illustrated throughout with over 200 informative diagrams and attractive photographs all in colour *Introduction to Geomorphology*

Mr. Rohit Manglik, 2023-12-23 Studies landforms earth surface processes and the evolution of topography including the roles of weathering erosion plate tectonics and climate in shaping landscapes **Geomorphology** Robert S. Anderson, Suzanne P. Anderson, 2010-06-17 This textbook provides a modern quantitative and process oriented approach to equip students with the tools to understand geomorphology Insight into the interpretation of landscapes is developed from basic principles and simple models and by stepping through the equations that capture the essence of the mechanics and chemistry of landscapes Boxed worked examples and real world applications bring the subject to life for students allowing them to apply the theory to their own experience The book covers cutting edge topics including the revolutionary cosmogenic nuclide dating methods and modeling highlights links to other Earth sciences through up to date summaries of current research and illustrates the importance of geomorphology in understanding environmental changes Setting up problems as a conservation of mass ice soil or heat this book arms students with tools to fully explore processes understand landscapes and to participate in this rapidly evolving field **Bulletin of the Geographic Society of Chicago** Geographic Society of Chicago, 1928

Encyclopedia of Geomorphology Andrew Goudie, 2004 The first such reference work in thirty five years this is a comprehensive guide to both specific landforms and the major types of processes that create them This two volume set provides a historical overview of the field while exploring recent key discoveries about tectonic and climatic changes as well as the use of new techniques such as modeling remote sensing and process measurement Written by a team of expert contributors from over thirty countries the nearly 700 alphabetically arranged entries are cross referenced indexed and include up to date suggestions for further reading Fully illustrated with over 360 tables and illustrations this will be the definitive reference source for students researchers and practitioners in geomorphology as well as geography earth science

sedimentology and environmental science **Geomorphological Processes** E. Derbyshire, 2019-03-13 This book originated from a proposal by one author J R H who was subsequently joined by a second E D and then by a third K J G It has taken longer to produce than we expected because of the complications imposed by the distances which the authors have succeeded in putting between themselves during the past three years The basic objective was to produce a short book which would introduce geomorphological processes to students in the first or second year of their higher education courses We believed that there was a need for such a book reviewing a range of geomorphological processes which would offer a prelude to the symphonies which are available in books devoted to specific processes and their effects many of which are sign posted in the lists of further reading at the end of each chapter We are aware that the range of suitable preludes is wide but we have endeavoured to compose one which expresses at least some of the recent achievements in the study of geomorphological processes Emphasis is placed on the nature of processes and upon their controls but the effects of processes in creating landforms are not reviewed in any detail In addition to the selected references at the end of each chapter we have collected a bibliography of works cited at the end of the book but this is not intended to be as exhaustive as the references collated in more advanced works **Sedimentary Environments** Harold G. Reading, 2013-07-03 Sedimentary Environments is one of the most distinguished and influential textbooks in the earth sciences published in the last 20 years The first and second editions both won universal praise and became classic works in sedimentology Since the publication of the last edition the study of sedimentary environments and facies has made great strides with major advances in facies modelling sequence stratigraphy and basin modelling The 3rd edition of this classic text will likely set the benchmark even higher and needless to say will continue being the textbook of choice for sedimentology students The latest edition of a classic text Incorporates all the latest advances in dynamic stratigraphy Will remain the textbook of choice for upper level undergraduate and graduate students in sedimentology **Fundamentals of Geomorphology** Richard Huggett, 2013-07-04 This extensively revised and updated edition continues to present an engaging and comprehensive introduction to the subject exploring the world's landforms from a broad systems perspective It reflects on the latest developments in the field and includes new chapters on geomorphic materials and processes hillslopes and changing landscapes Fundamentals of Geomorphology is an engaging and comprehensive introduction Starting with a consideration of the nature of geomorphology and the geomorphic system geomorphic materials and processes and the quest of process and historical geomorphologists it moves on to discuss structure landforms resulting from or influenced by the endogenic agencies of tectonic and volcanic processes geological structures and rock types process and form landforms resulting from or influenced by the exogenic agencies of weathering running water flowing ice and meltwater ground ice and frost the wind and the sea history earth surface history giving a discussion of Quaternary landforms and ancient landforms including the origin of old plains relict exhumed and stagnant landscape features and evolutionary aspects of landscape change Fundamentals of Geomorphology provides a stimulating

and innovative perspective on the key topics and debates within the field of geomorphology Written in an accessible and lively manner it includes guides to further reading chapter summaries and an extensive glossary of key terms The book is also illustrated throughout with over 200 informative diagrams and attractive photographs including a colour plate section
